A UK user group, TWAUG, published what amounted to a revised copy of Mapping the Atari a few years ago called 'The Complete and Essential Map'. It came in two volumes. The second volume included some extras including an XL OS listing. It wouldn't take too long to have it scanned.

Unfortunately my copy isn't with me at the moment. Hopefully I'll be going back to pick it up at the end of the month.

Analog published a CIO mod for DiskTool around issue #13 or so which cut the init time for the ML stuff from several minutes to about 11 seconds. Later I added their G colon driver and altered the display mask for all characters except $9B to get screen dumps of the Atascii stuff at the right hand side. Finally we allowed writing sectors to any place on the disk, wedged in a hex number converter, block of sectors relocator and a disassembler.

> llpwhite@cs.com (LLpwhite) remarked:

Lots of "single executable" files are fragmented for DOS to load them into
multiple address loactions. With a LOT of work or an Omnimon, it is
theoretically possible to make a large single contiguous block of code for
booting by changing the headers and placing the init & run at the beginning.

>dunxuk@aol.com (DunxUK) replied:

Hi, Nearl.
Don't think I have it backwards. 'C' is just 12 bytes different from
'B', and there is no shifting of code with 'C'. 'B' is quite different
from 'A', I'm sure it is a re-compile. I mean, do a compare on the
three versions. 'B' will turn up lots of differences, maybe because
only one byte shift means the rest of it will not correspond, byte for
byte. There may not be that much difference between 'B' and 'A',
but a simple file compare will show lots of differences. 'C', on the
other hand, is just 12 bytes are different, the rest is exactly the
same as 'B'.
Russg
(I'll probably go do a ROM compare under DOS, just to
verify what I'm saying. That's what I did to make the statement.)

Sorry to answer so late and incomplete but I've been on vacation last
week.

Danger in Drindisti I sent to Aaron several month ago. So it should be
available to the public. If not you can email me for it.
I don't know whether I sent him Clear for Action too. I'm sure I sent
him the scanned manual for it.
The others I'll have to check.

Gerhard

Have you used them? I've used 'B,' when 'C' came out I bought a couple carts
and swapped out the ROM in my 800 XL. 'B' was quite a bit different from 'A'
but they ended up making it worse. 'C' is the fix for 'B.' The revised
"Mapping the Atari" lists the differences between 'A' and 'B.'

Message-ID: <3b1cfbe9$0$88179$4c5ecdc7@news.erinet.com>
Source record: 36394

Hi, Nearl.
Yes, I've used 'B' extensively. I tried 'C', but had bad problems
with lockups, messed up variables and went back to 'B'.
My opinion comes from my experience. I haven't used 'C' extensively
like I have 'B'. 'B' came with my first 800XL. I don't remember where
I got the 'C' ROM.
I think 'Mapping the Atari' has the OS B and A differences, not
BASIC 'A' and 'B' differences.
Regards,
I did verify the 12 byte difference. You can't use MS COMP for
the compare, however, because COMP quits after 10 differences.
I used my own compare program, written in MS QuickBASIC 4.0.
Russg

(About Atari BASIC).
I don't want to sound like I never have/had problems with Atari BASIC 'B'. It has problems, documented and undocumented. It will lock up, mess up variables, trash your file, become unLOADable, unENTERable. In fact, probably many people try Atari BASIC and look for a better language (ACTION!, C, Pascal, Assembler). ALL of them will lock up, and have problems. This is true of any language I have worked with extensively. Probably lots of people use Frank Ostrowski's Turbo BASIC, I haven't used that one enough to comment on it, I like built in BASIC because it is convenient and universally available on the A8. I have used 'B', ACTION!, on the A8 enough to experience problems with both those. I even occasionally get lockups, etc. with MS QuickBASIC. Every language I've used extensively has had bugs. My opinion is that 'C' is more prone to crashing, messing up, than 'B', not that 'B' is perfect.

> with lockups, messed up variables and went back to 'B'.

Strange enough, I had various lockups with the B revision (came with my
first XL). No messed up variables with B, though. The problem of "B" is
that one of the "memory move" subroutines was severely broken and did
not copy correctly if the number of bytes to copy was aligned to 256 bytes.

So long,
Thomas

3423. Atari 800xl stuff for sale or trade in UK

Newsgroup: comp.sys.atari.8bit
Date: 2001-06-06 00:53:09 UTC
From: Al <high.rise@virgin.net>
Message-ID: <R98T6.5628$fs6.256490@news6-win.server.ntlworld.com>
Source record: 36397

Hi

I have the following for sale :

Atari 800XL with PSU and RF lead. It seems to boot up fine, but I can't get a decent TV signal. I suspect that it is because of the change in UK voltages from 240 to 220. Otherwise it seems to be OK.

Atari 1050 Dual Density Disk Drive with leads, no disk or manual

Atari 1020 Printer

Atari 1027 Printer

All these items are in excellent condition, and still in their original polystyrene and boxes (boxes have some wear but nothing disastrous).

Offers to high.rise@virgin.net - all serious bids or trades considered - I am interested in games consoles, Atari or otherwise, and console games.

Allan

Games I dumped to ATR and verified that they work on emulator :

Danger in Drindisti 1982 Automated Simulations (disk)
The Nightmare 1982 Automated Simulations (disk)
Puzzle Panic 1984 Epyx (file)
Gulf Strike 1984 Avalon Hill (disk)
Knock-Out 1982 Avalon Hill (disk)

dumped but not yet verified :

Titlebout (basic) 1985 Avalon Hill (disk)

dumped but not working ? :

? Clear for Action (protected) 1984 Avalon Hill
disk
Spitfire '40 ? ? (disk)

'deprotected' but not yet dumped (maybe this evening) :

Clear for Action 1984 Avalon Hill (disk)

One game is missing in Jindrichs list that I've read about but have
never seen it anywhere :

Mission on Thunderhead ? Avalon Hill

Welcome to the comp.sys.atari.8bit newsgroup!

Atari 8-Bit Computers

Vendors and Developers List

"A comprehensive list of vendors, developers, publishers,
and repair shops for Atari 8-bit computers and their users"

Additions/suggestions/comments/corrections are needed! Please send to:

Michael Current
mailto:mcurrent@carleton.edu

Please refer to the latest version of this FAQ list whenever possible!

Available via these locations and Usenet FAQ archives everywhere:

http://www.faqs.org/faqs/atari-8-bit/vendev/

ftp://rtfm.mit.edu/pub/faqs/atari-8-bit/vendev

news:comp.sys.atari.8bit news:comp.answers news:news.answers

Or you can always ask me for a copy at mailto:mcurrent@carleton.edu

------------------------------

Subject: Introduction

Conventions
-----------
All commercial vendors, developers, publishers, and repair shops should be
listed here. "Major" PD/freeware/shareware developers should also be listed.
Persons or entities holding rights to products, but not selling or supporting
them in any way, are NOT listed here.

"Vendor" = Reseller of products produced by others. Types of products
sold are given in categories: new hardware, used hardware, PD/freeware/
shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the
developer are listed. No product can be developed by more than one
developer. No prices are given.
```

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices.

"Repair Shop" = Can repair many 8-bit Atari and related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

When writing to request catalogs, it's always a good idea to include a Self-Addressed Stamped Envelope. When writing to foreign firms, try enclosing a couple of International Reply Coupons (IRC's) as well.

Super-Brief Copyright Primer

Commerical software - protected by copyright, may not be copied except for personal archival purposes
Shareware -protected by copyright, may be freely copied and distributed, shareware payment required for continued use
Freeware - protected by copyright, may be freely copied and distributed, no payment required for continued use
Public Domain software - NOT protected by copyright, anyone may do anything with it, period.

Software is protected by copyright from the moment of creation. No copyright notice is required for copyright protection. Software does not enter the Public Domain unless explicitly released to the PD *by the copyright owner*.

My article "Intellectual Property Protection for Computer Software" appeared in Atari Classics, 3(1), 1994, pp. 4-7, or see:
http://www.library.carleton.edu/staff/michael/acarticle.html

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

"Hi!" to Marek Tomczyk, who has supplied so much information from Germany.
"Hi!" to Alex Martin, who has done the same for the land of Poland.

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!

Archive-name: atari-8-bit/welcome
Posting-Frequency: 7 days
Last-modified: May 28, 2001

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

OTHER USENET NEWSGROUPS:

In article <3b1cfbe9$0$88179$4c5ecdc7@news.erinet.com>, russg@en.com says...
>
>
>Hi, Nearl.
>Yes, I've used 'B' extensively. I tried 'C', but had bad problems
>with lockups, messed up variables and went back to 'B'.
>My opinion comes from my experience. I haven't used 'C' extensively
>like I have 'B'. 'B' came with my first 800XL. I don't remember where
>I got the 'C' ROM.

I had so many problems with 'B' that I quit using it completely. The editing bug was too easy to set off.

>I think 'Mapping the Atari' has the OS B and A differences, not
>BASIC 'A' and 'B' differences.

Doh! (slapping myself on the forehead). Teaches me to look something up so early in the morning. However, on page 250 has a version 'B' fix written by Matt Ratcliff. See page 212 about decimal 43234 mem location and Appendix Thirteen.

>Regards,
>I did verify the 12 byte difference. You can't use MS COMP for
>the compare, however, because COMP quits after 10 differences.
>I used my own compare program, written in MS QuickBASIC 4.0.

I don't doubt the 12 byte difference at all. 'B' was a rewrite and 'C' is the fix. The revised "Mapping the Atari" was the only book I could find that was written after '84. 'B' was shortlived and 'C' is whats used in the XEs.

TurboBASIC XL is sweet. After I got my hands on it, I only used the built in BASIC if I wanted to do a quick '?.' Remember those benchmarks that used to be in Creative Computing? Compiled TurboBASIC cut something like 4 minutes off the time.

3428. a800 1.0.7 sound problems?

Newsgroup: comp.sys.atari.8bit
Date: 2001-06-06 14:26:24 UTC
From: Alberto BARSELLA <ishark@lsh01.univ-lille1.fr>
Message-ID: <m2ae3lhegf.fsf@pcmaxwell.intec.rug.ac.be>
Source record: 36402

Hi,
after some time (and many versions) I downloaded the new
release of the emulator a800s107. I'm running linux (2.2.19) and X11,
and I tried both the binary release and recompiling the source, but
the sound just doesn't work....
Is this a known problem or it's something wrong with my system? (BTW
xmms plays music just fine).

Thanks,
Alberto

Source record: 36404

I have an Atari 65XE with a bunch of games open to anyone that might be interested, It was well used about 12 years ago but has been siting in a cupboard since then. It is still in working order with the tape drive, but I've not tried any of the games (recently).

Just thought one of you guys might be interested, if so I am in the South of England.

3431. Bounty Bob Strikes Back Codes

Newsgroup: comp.sys.atari.8bit

From: Paul Barker <pbarker@ntlworld.com>
Message-ID: <ToxT6.14040$fs6.960990@news6-win.server.ntlworld.com>
Source record: 36405

Hi

Just been playing BBSB for the first time in a while on my trusty old XL.
DOes anyone remeber any of the "special codes" that could be input on the
options screen?

I seem to remember that you could get a few different effects and that there
was one "meag code" which let you skip levels etc.

Anyone ?

See Ya

Paul

3432. Basic XE SORTUP Problem

Newsgroup: comp.sys.atari.8bit
Date: 2001-06-07 00:38:46 UTC
From: llpwhite@cs.com
Message-ID: <20010606203846.18258.00003374@ng-cj1.news.cs.com>
Source record: 36406

I ran into a wierd problem today with BXE. I was sorting a large string array
of 1300 elements by 17 bytes. When I got to the point of
250 SORTUP RECARY$
my 130 XE did a cold start.
Checked memory and showed about 5K to spare.
Tried EXTEND to put the code into the extended banks. Lots of room now, but
same thing - a cold start.
Must be my Black Box, so disconnected it - same thing.
Must be MyDos -- so I tried Dos 2.5 - same thing.
Tried using only 300 elements - same thing.
The really wierd thing is that I have used SORTUP many times, although not with
this particular XE. Guess I should run a memory check, although I can load and
print the array with no problems, just when I try to sort it using SORTUP. ???
Any thoughts?
Larry

I guess I never found out about those; the docs mention typing in their phone #
to "help" you out of traps which I am apparently not yet doing correctly...

You will get a message after several screens about skipping ahead. "Start" plus
the digit "1" while energized by collecting the flower pot at the top center of
level 1 sends you to level 4. I am sure others are presented as we progress.

Please use the enclosed email link within this post rather than your reply button, email not properly addressed may not be able to be responded to.

Last Updated 6/06/2001
- Sold/Traded Items Removed

I have a limited amount of brand new (sealed) Atari Jaguar items for sale or trade. These packages are ideal for new collector's or somebody wanting to start or add to their Atari collection. If you have any questions, please feel free to ask. I am also willing to trade for certain items, please see my list at the end of this post. All prices quoted are in U.S. funds with the buyer paying shipping. Overseas shipping is available.

Due to all the game titles being in short supply, all titles with the exception of CyberMorph are available only with the purchase of a Jaguar game system.

If you are interested in any of these items, please respond to me by using this automated link jim_l@NO.SPAM.telusplanet.net?subject=Classics.Atari.Jaguar (removing the NO.SPAM. first). Or email me if you would like a current listing of items I have for other systems (Atari 2600/5200/7800/Jaguar, Colecovision, Intellivision, Classic Computers (Vic 20/C64/ADAM/Atari), Vectrex, Microvision, or Handheld games) sent to you, (please specify system).

** Atari Jaguar Packages - Brand New (with controller, RF Box & AC adapter)**
==========
-.Atari Jaguar with CyberMorph cartridge and Composite Video Cable $45
- Atari Jaguar with CyberMorph cartridge $35
- Atari Jaguar (No Cart) $25

** Atari Jaguar Accessories - New**
==========
- Team Tap (4 Player adapter) $20 - (Limited Supplies)
- Jaguar unit alone (No power supply, controller or accessories) $20
- Composite Video Cable $10
- Spare Controller $15 (Limited Supplies)
- AC Power Supply $10 (Limited Supplies)
- RF Switch Box $5 (Limited Supplies)

** Atari Jaguar Games - New/Shrink-wrapped**
==========
Due to all the game titles being in short supply, all titles with the

exception of CyberMorph are available only with the purchase of a Jaguar
game system.
- Checkered Flag $15
- CyberMorph $5 (No Box)
- Kasumi Ninja $30
- Tempest 2000 $40
- Troy Aikman Football $30
- Wolfenstein 3D $30

Atari Force Comics Please make an offer
==========
All are in Mint Condition
- Issue #2 - February 84
- Issue #3 - March 84
- Issue #11 - November 84

Trades
==========
I am also willing to trade for/towards rare or sealed titles for...
- Intellivision, Colecovision, Vectrex or various Atari systems
- Shrink-wrapped Intellivision NHL Hockey or PGA Golf
- Shrink-wrapped or mint SEARS Telegames for the Intellivision
- Shrink-wrapped or mint DigiPlay games for the Intellivision
- Shrink-wrapped or mint Intellivision Tutankhman, Super Cobra or Popeye
- Intellivision Congo Bongo, Draughts, Triple Challenge and Fathom
- Rarer Mattel and Coleco Handhelds (a list is available upon request).
- A complete brown variation of the Intellivision ECS
- A World Book Tutorvision (Intellivision III Clone)
- A complete Atari Jaguar CD Unit or Jaguar Accessories
- Atari Jaguar Games (Most titles)
- A working Vectrex controller
- Atari Force Comics Issue #1 (January 1984), Issues 4 thru 7, and Issues
12 thru 20

Jindroush (kubecj@asw.cz)
See http://www.asw.cz/~kubecj for best Atari 8-bit utilities...

OK, there are some other simple cheats, but the "Big one" is this:
Go to the Options screen (with "Option" :-), and using your joystick,
set "special code" to 61800 (This takes a while, but it's worth it).
This only works immediately after starting the game!

Now hold down the letter "f" key and press OPTION again. So that's
F and OPTION together. It seems as if nothing has happened, but in
the game, you can use the following keys:

- Q : Advance one level
- A : Decrease one level
- B : original position
- Z : Same level again
- F : Float mode on: This one's great: If things get too hard or
impossible to play, just press F and float your way around the
screen.

How to jump to higher levels:
>From 1 (Bob's morning calisthenics) to 4: get the flower pot,
then press "1" and "START".

>From 2 (utility hoist) to 22: kill the mutants, get the paint roller
and then press "3" and "START".

>From 3 (suction tubes) to 15: get the goblet then press "4" and "START".

>From 5 (jumping 101) to 8: get the coffee pot, then press "8" and "START".

>From 10 (gravity lift) to 14, get the pitchfork and then press "5"
and "START".

>From 16 (Advanced Suction Tubes) to 19: turn arrow in suction tube #1
to the left, get the pie and then press "9" and "START".

Howdy folks

>You can pencil me in for one of those -
>Will it work in an OmniMon equipped 800xl?

I've printed you message out, so I won't forget. It might take a whiel before the PCB's are made. I have little time and no oscilloscope to find the last bugs.

Does it work on the OmniMon?

I have no clue. Depends on whether the omnimon can access XE compatible RAMdisks. And how it does so. If assumes some bits in $D300 are never used for RAMdisks, it probably can only access part of the RAMdisk. (often the OS ROM/RAM bit is thrown out)

A built in BASIC is something I've missed through the years. 8-) I will agree
that the ST's BASIC left a lot to be desired. I guess its a good thing that
GfA BASIC was so great.

The drive mech that comes with the XF551 can read/write 360k disks as is. You must use DOS or a format command to put the drive/disk into that cpacity first, then format the disk With MYDOS, just use "O" to set the drive as double sided, then "P" for double density, then "I" to format the disk.

You probably had problems because you used a 1.2 meg mechanism that will NOT work with the XF drive controller.

P.S., Notching a disk to use both sides is called "Flippy", each side is a seperate disk, as opposed to dbl sided where both sides are one big disk.

And you can't use HD 5 1/4" disks, they will not format or format right.

Yeah, I got these games second hand and have a feeling that it's an alien catalog. It's way to pretty to be from the 'early' 80's. Funny thing, usually these have some sort of copyright date in them, this one doesn't. At least not that I've spotted. I was surprised to find that Microprose originated in the U.K. I know they're still around but probably in the USA, it would be a good topic for a company biography.

I am not sure about the linux version, but I am using the Atari version
on a Hades060. I have never gotten any sound, but that is due to a
problem in the drivers/hardware...

3451. Multiboot question

Newsgroup: comp.sys.atari.8bit
Date: 2001-06-08 08:27:32 UTC
From: Janka Gerhard <gerhard.janka@siemens.at>
Message-ID: <3B208C74.D94A967C@siemens.at>
Source record: 36425

Hi all,

Long ago to save space and time I put some of my files to 'happy
multiboot' or 'xl multiboot' disks. Now I wanted to make ATRs of
them which didn't work. So the question is how to get files out
of such a disk again. I only found utilities to create such disks
and put files on them but not the reverse way. Another related
question is how to extract files from existing ATRs of that type.

Thanks
Gerhard

the Uk has not changed its voltage from 240v to 220v !!

anyhow this would not effect the picture on the TV at all, i would say that
the modulator on the computer is duff of the demodulator on the TV is, but
that would also mean u cant get a standard TV picture either

The UK voltage varies across that range anyway..Hence you see 220-240 on
almost every appliance

>anyhow this would not effect the picture on the TV at all, i would say that
>the modulator on the computer is duff of the demodulator on the TV is, but
>that would also mean u cant get a standard TV picture either

Chances are the modulator is out of tune, there's a nice screw on the XL's
bottom to turn to try and tune it a tad better. If the modulator is shifted
in freq then a picture would still be got but not on channel 36.

If neither of these work then it's duff and not a real joy to fix.

Source record: 36431

Well,
how did you get the game working in 2 player mode ?!? Just a key press -
or did you enhance the program ??? By the way: did you beat the computer
player more than once in 20 games (or five times in hundred tries) ???
Is there any way to slow the game (and especially the computer opponent)
down ?? Actually it is much tooooo fast for me and thus almost
unplayable. The computer acts much too fast, so you do not have any
chance to start your own attack. All you can do is trying to defend
yourself (which does not last long for me - I am dying soon and often).
-Andreas

Source record: 36433

Well,
at that time (1982-1984) it was really clever. Not many people knew how
to sample something on an Atari (nor on an IBM!). And how many sound
samples were around at that time - not many, I believe. Maybe
Ghostbusters, E.T., Whomper stomper and a few more titles. Only a few
Atarians had sampling systems at that early time...
-Andreas

P.S.: On the other hand, sampling was an easy thing in later years.
Quite many sampling systems (home made and commercial) were around. Most
were 2Bit sampling systems - and I am not pretty sure if the Van Halen
demo was/is really 4Bit or also just 2Bit...

That is true. I remember how friends interested in home computing came to see me just to hear my Atari play the sequence of Van Halen's "You really got me" song. (The song was originally made by the Kinks, right?)

> ... And how many sound samples were around at that time - not many, I
> believe. Maybe Ghostbusters, E.T., Whomper stomper and a few more

Add to that list the fantastic synthesized speech in the 16 KB Berzerk cartridge. (Or is it 8 KB?)

Anders

Just in case you didn't notice, the C=64 web browser uses a shell account.
No TCP/IP involved, I imagine.

A simple shell script on one end that read from STDIN and ran
"lynx -dump" on the URL requested should suffice to fetch HTML.

Add some smarts on the Unix end and the Atari won't really have all that
much to do other than user interface! :)

Exactly, I think the real hold up is the shell account. The only place I've found in Houston that'll do it for ya is HAL-PC and you have to go to there office and register with identification. Not to mention they're kind of pricey.
What we need is an ISP that caters to vintage hardware. Right down to 300 baud dialups!

Yep, press select so that the number in the middle = '20'
and then press start.

> or did you enhance the program ??? By the way: did you beat the computer
> player more than once in 20 games (or five times in hundred tries) ???

I don't think I did beat him! But I was using the
numeric keypad on my PC ;-(

> Is there any way to slow the game (and especially the computer opponent)
> down ?? Actually it is much tooooo fast for me and thus almost

If your using A800Win you can run the emulator as
a percentage of the orignal PC, though how this affects
your control has to be decided.

> unplayable. The computer acts much too fast, so you do not have any
> chance to start your own attack. All you can do is trying to defend

The easy answer to the (subject) question is that there are a lot more C64
folks still active in developing their hardware and software.

But lurking on the other side of this particular coin is another question --
WHY would I want to browse the web with a text reader?

There are lots of useful and interesting things that can be done with an 8-bit,
but "surfing the web" looks like a pretty barren field to me.

Forgive me for sounding like a broken record, but why do you need an ISP with a shell account when you set up your own at essentially no cost?

All you need is a PPP account and a 386 or better PC, and Linux. The PC needs at least 8 Mb of RAM, a modem, 2 serial ports, a floppy drive, a cheap video card, a cheap monitor capable of displaying 80x25 text, and a keyboard. A hard drive with maybe 50 Mb would be nice. The monitor and keyboard aren't absolutely necessary, but makes things a lot simpler. People are dumping PCs like this in the trash, or stowing them in the basement!

With the above hardware, You have enough to set up a machine that can dial-up an ISP, connect via PPP, and give you a shell account on one of the serial ports that can run a Perl script to shuttle data between your 8-bit computer and a web server. That's all the C64 setup is doing (the other serial port is for your SIO2PC connection, of course :)

The reason it's so hard to find ISPs with shell accounts is because it's hard to provide dial-in shell accounts without leaving your system open to hackers. Also, hackers tend to use these systems as a base for their activities, and ISPs don't want to appear to be promoting hackers (please note that I'm using the contemporary definition of hacker, with all the bad connotations)

If your system is dial-out only, as the Linux box would be, it's not as hard to make it secure, and not as likely to be hacked.

The only downside I see with this is the space the PC takes up. I'm solving this (soon) by using a small single-board PC with 8 Mb of RAM and 4 Mb of flash. It also has an ethernet interface so I can use any of my other PCs on my network for disk storage. My SBC is also using the network to get out to the Internet, but it could easily make a dialup connection through an external modem. The SBC plus modem together take less space than my 810 drive.

As for the complaint someone made before, that they want to connect "directly" to the Internet with their 8-bit, I have to ask what that means? The Internet is a collection of internetworked machines. Some interconnections are serial cables, some are phone lines, some are DSL, cable, whatever. Does it matter whether your shell account connection is via serial cable to a machine in your house, or a remote machine on the other end of the phone line? In both cases you're on the Internet. In both cases, your 8-bit is using a shell account to hide the TCP/IP protocol stack.

I won't get into all the other cool things you can do with a Linux
box.

In any case, it's only going to get harder to find ISPs with shell
accounts.

Phil

p.s. Sorry if this sounds a bit heated - I didn't mean it to be.

Has anyone come up with a SIO2PC for the atari 2600 VCS? It just occured to me that a special cable could be made that would plug into the cart slot and emulate a cartridge. I downloaded the Stella emulator and the ROM package that has just about every 2600 cart ever made. Yes, I know this is the 8bit group- the 2600 group is nothing but spam and gives me headaches. Seems like this could be done for the 8bit as well... Just thinking out loud.

It must be possible if some RAM were involved. I just found in a box of misc A8 equipment something called a SuperCharger from Arcadia Corp in Saratoga, CA dated 1982; it includes a game data cassette and a cartridge with a mini plug for connection to a tape player. Evidently you 'boot' the cassette game into the 2600 and I must assume the cart contains the ROM loader code and the necessary RAM. Anyone else ever seen one?

Its been done... its a 3rd party cart called a "SuperCharger" (the manufacturer's name escapes me at the moment... is it Arcadia.... or Starpath... hmmm?) and has a mini din plug to connect to a cassette recorder (its intended use when it came out in the 80s) or PC Sound card. There are apps to convert a 2600 cartridge dump into a wav file, then you just play the wav and the game appears on the 2600! The stock SuperCharger needs a slight mod to work with every cart out there. I have a stock one and it seems to work with about 75% of the cart images. I don't have any links for you, but there are some nice pages about this subject, including instructions for the mod if you search for it. I believe you can get a SuperCharger pretty easily on ebay (got mine in a junk shop).

I'm pretty sure that Microprose originated in the US. Hunt Valley, Maryland
to be exact. It was started up by Sid Meier and a couple other people. It's
kinda funny....both Atari and Microprose are owned by the same company now.

I just bought an Atari 800 a few days ago. I took it apart so I could clean it real good when I noticed the Atari RAM Memory Expansion Carts. What all Atari computers used these carts? I haven't seen any other Atari computers except for the 400, Could these carts be used in a 400 to play 48K games? Are there any carts with more than 16K on them? If so would it be possible to play XE carts if I had 64K on my 800?

> John
>
>
>
John,
No. Only the 400/800 used the 16KB RAM carts. The XL/XE series
used simple RAM chips 16x64K bit in the 130XE. I believe it was 8x64K
bit for 800XL and 65XE.

hi john,
64k xe games will not play on a 400, or 800 regardless of the memory,
xl/xe's have a differnet os, and 400/800's do not have ram under rom.
your machine can play all 48k, or less carts, and some xe carts used as
little as 16k.
please check my web site at,
www.atarisales.com
we list the memory requirements besides each cart so that will give you
a idea,
thanks,
lance

I have a new/unopened copy of Atari 400/800 Half Time Battlin Bands
rare up for auction on Ebay, as well as a bunch of other items

You can check the auction at:
Item # 1244087254
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1244087254

Thanks,

Richard.

Why don't you try http://www.abbuc.de
Then "Bauplanservice"
Then "Buecher"

"Buch9 Action Handbuch, Deutsche Uebersetzung der Programmiersprache Action!,
DM16.00 etc.etc"

BTW IIRC there should be a German Action Workgroup somewhere. Wasn't Carsten
Strotmann one of them. http://www.strotmann.de

Howdy folks

I'm trying to write a CD Audio Player utility for my Atari 8 bit computer and have run into a problem. The READ SUBCHANNEL command doesn't seem to want to return any data. (no subchannel data sent is what it tells me). Could this be the CDROM (Pioneer Slot-In 32speed) or my fault?

Thanks in advance

CU Mathy van Nisselroy

PS does somebody know if there is a way to detect via software if the CDROM can load a CD (as in: does it have a tray, or does it use a caddy/is it a slot-in machine)?

PPS anybody know where the CD Text info is hidden (if available)?

ISTR there were projects published that allowed you to sample via the
paddle ports around that time.

Umm, I think you'll find they have been slowly cranking it down to bring
it in to line with other Euro countries. It hasn't been rated at 240 for
some time.

If the CDROM drive is MMC compliant, you should be able to read its features with
the GET CONFIGURATION command. The Removeable Medium Feature (0003h) descriptor
has a field (high 3 bits of byte 4) called Loading Mechanism Type:

0 = Caddy/Slot
1 = Tray
2 = Pop-up
3 = Reserved
4 = Embedded changer with individually changeable discs
5 = Embedded changer with magazine
6 - 8 = Reserved

(this came from the MMC-2 working draft NCITS 333 T10/1228-D, Rev-11a,
August 30, 1999, www.t10.org/drafts.htm)

Regards,
Phil

Yes, most vendors supply their SCSI machines with various "vendor-
specific" capabilities. You are supposed to look for these features
when interrogating the SCSI device.

For instance, the "Floptical" disk drive I had with my ST, would
eject the media only if I sent it an eject media command. There
was no latch or button to pop the media out. You actually had
to issue an eject command if you wanted to switch out the floptical
media. Royally annoying.

Or, in the alternative, I think you had to straighten out a
paperclip, and push it into a teeny little hole to get the media
to pop out. And the company that manufactured the floptical had
the nerve to demand a "contract of nondisclosure" out of me,
just to get the vendor specific information out of them. Sheeeesh!
```

Only the 800 accepts those memory boards without some modifications as the 400 had no slots for them.

Axlon made some 128K memory boards for the center 800 slot; the additional 112K was bank switched into the address space mostly for RAMdisks. Extra memory in the same space does NOT affect your XL/XE compatibility.

A majority of those XE carts were 400/800 compatible; they mostly had the needed extra memory in the cart ROM and only used RAM for the display and a little work space.

Do you have a copy of this PERL script? Also, how exactly are you
connecting your 8bit to your Linux box? (full explanation would be
fine; I am a Linux geek.) Do you connect an 850 interface to the
Linux box via a null modem cable or do you have some program to
take data over the SIO2PC cable as an R: device? Is there such a
program to do the latter? If not, why not? (Okay, okay, enough with
the questions)

Oops. I realized, about an hour after I posted, that I was clueless
about how to do serial IO on my Atari 800. I was assuming there was
a serial port, but later it occurred to me that maybe the only serial
port is the SIO port?

How do people dial out to ISPs?

It would seem to me that if you can connect a modem, you should also
be able to bypass the modem and do a direct serial connect.

Does the modem connect to the SIO bus as well?
Guess I'll be scanning the FAQs again.

I should qualify everything I've said so far by noting that I haven't
gotten my SIO2PC cable hooked up yet. I plan to test it out with MSDOS
tools first, then get it working with Linux. So I don't have a good
feel yet how well this setup will work with Linux. I have heard the
SIO2PC tools work better under Linux/dosemu than they do under
win32/dosprompt.

Cheers,
Phil

p.s. I WILL get SIO2PC working on the SBC under Linux (eventually)
and I WILL post pictures and info at that time, if anyone's
interested. :)

Everything I know came from the documents at www.t10.org/drafts.htm, and
Linux stuff. The Linux stuff was mostly the source for cdrecord, plus an
in-house tool that was adapted from another Linux utility. I'm planning
on removing some proprietary parts from the tool, after which I can
make the code available, if you're interested. It's mainly for working
with MMC CDR and CDROM drives (in a Linux environment).

Actually, I have a setup almost identical to what you are describing with the exception of the use of a telephone line simulator that I use to 'dial in' from modem to modem. That way it kind of completes the early 8bit dial-up experience. It also keeps the dust off my old rotary and my acoustic coupler. The idea here is to dial up without having to boot an auxillary machine, granted I use it quite a bit as a peripheral emulator (APE) as well. I've also fitted it with an adaptec scsi system and a 5.25 DD floppy that's capable of reading and writing disks for my TRS-80 model 3. To answer the TCP/IP question, to dial in directly you would need TCP/IP support, you'd also need at least a 2400 baud modem (and that would be pushing it!). Using a Linux proxy server to dial through, your 8bit is essentually a terminal and requires no 'stack'. The linux machine does need two modems for the setup I'm running, ones a 300 baud TRS-80 direct connect that's plugged into a serial port. The others a standard 56k. You could just cable the two computers together if you only have one modem.

Howdy Martin, folks

>Sorry to butt in on your thread, but where can I obtain scsi programming
>information. I did a big netsearch but it came up with lots of linux stuff.

Threads are for butting in. So, butt in. :-))

I just used the source code of another programm for my Atari. With the approval and help of the original author. There seems to be a very good book, with SCSI and IDE in the title, sold by Addison Wesley and written by a german guy. Another source is a list that can be found on the net (don't ask me where), that has a description of the commands, the structure of the commands and a lot of notes. This list has a lot of notes and has CD ROM's in chapter 14.

There have been some home made CD players, writers and such
for the Atari ST. Perhaps asking for docs in the ST section
might help? Just an idea.

I have found a Fall '86 / Winter '87 Catalog for S.S.I (strategic simulations inc.) consisting of 14 pages of New Games and New Conversions, SSI Classics, Fantasy, Fantasy Science Fiction, and Educational Entertainment, Wargames, Wargames and Sports, Data Disks, More Data Disks, etc. The games all appear to be in Apple, MacIntosh, IBM pc & pcjr, Commodore Amiga and C64, Atari ST and Atari 400/800/1200 format. Gives screen shots and box pictures of the various games. Book is in excellent condition and appears to have been included in a game box at one time.
I also have a Tenth Anniversary SIERRA catalog, looks like a 1989 print, very good condition and shows games for MS Dos, Atari ST, MacIntosh, Apple series computers, And the Amiga. There are 47 pages in this one and the order form is still attached to the inside of the catalogue.
For Micropose I have two triple fold-out cardboard order catalogues in excellent condition and the games shown are for IBM-PC, Tandy, Amigas, C64's and Atari St's. There are three loose paper sheets with these two items as well.
The last one I have found is a 12 page LucasFilm Games flyer and although there are various screen shots for each game I don't know what computers they might be for.

Awesome! Gateway to Apshai is such a magnificent little game. I spent almost my entire youth playing its hundred-something levels, while my friends were all out getting drunk and having sex with many anonymous partners. Ain't childhood grand?

Just curious: has anyone here actually finished every map in the entire game?

I have an Atari130XE and the game ran fine. I didn't have to load any
additional software before playing it, and I never experienced any problems
during gameplay.

Maybe the version I have was updated or something...

Mine was a white ECA two-side disk called "AGE OF ADVENTURE" with Ali Baba
& the Forty Thieves on one side and Return of Heracles on the other.

Were these games released separately as well?

Available for download at http://www.iancgbell.clara.net/elite/demos/
is a work-in-progress, 1st release of an Elite Demo for the 8-bit Atari.

The demo comes as an ATR disk image which can be run through
most emulators under XL/XE mode, e.g. A800Win.

The demo starts with the rolling Cobra screen and by pressing the
Start key (F4 on A800Win) you'll move through the various
game screens, the demo cycles through 4 planets to exercise
the galaxy/local maps and planet description screens.

That's it for now, I'm off for a couple of weeks holiday!

Plans for the next demo...

Loading screen (I'm looking for a good 3 colour logo with black background).
Introduce the console readings (maybe the scanner objects too).
Add the other ships/objects and cycle through them as a second intro screen.

Thanks go to:

Ian Bell and David Braben for the original (and for Ian hosting the Demo)
(although I did grow up on the ST version, owning an 8-bit Atari
originally... ;-)

Ullrich von Bassewitz for the CC65 development tools (CA65 in particular)

Christian Pinder for inspiration through his work on 'Elite -The New Kind'!

Hello Mighty,

Just a word of advice. People (or bots) who post this spam don't come back to read our reactions to it. You're wasting emotional energy over this nonsense.

Same advice for obnoxious posts.

It's far better to just ignore them.

Take care.

>
> How do people dial out to ISPs?

Some modems connect directly to the SIO port, but there weren't very many, and I don't know of any faster than 1200 baud. What I used was a P:R: connection that adds an RS232 port to the SIO chain. It has two serial connectors that look like standard PC RS232 ports but are actually wired differently; I'm sure the pinouts are on the net somewhere. They are the same pinouts as the Atari 850 device, which actually had four ports of varying capabilities.

Most terminal programs load an R: driver (for RS232 I presume) that allows them to communicate through the P:R: or 850 (there were also other solutions), using the standard CIO protocols. One of the benefits of this design was that as long as a terminal program used the R: device, any terminal program could use any RS232 device by just loading the proper R: driver first. (And you could even prepend the right driver to the term program itself so they both load in one easy step.) Kudos to Atari for such a flexible design.

So using an Atari through a PC running linux would just involve routing one of the console windows through the serial port, and then a user can log in and run any text-based command such as lynx. On the Atari side, only a decent terminal emulator program would be needed. As for hardware, I think that a null modem is required between the Atari RS232 device and the PC serial port.

Mark

All I can say is that I've waited many, many years ! I always knew it was possible, through the rumours that there was an A8 conversion coming and through all my BBC, speccy and C64 owning pals ranting on about how great it was, and finaly playing and playing it on my Amiga 500.

Please, make it play on a *REAL* Atari !

Cheers

Paul

So it sounds like if I want to use my SIO2PC cable for emulating hard drives,
and also to support a modem emulator, I'll have to find out what the R: driver
protocol is and modify the PC-side code to emulate both disk drives and an 850
or P:R: (not sure what that is, looks like printer/parallel to RS232 adapter)
device?

And CIO is the name of the protocol for talking to a serial device?

Or I'd have to pick up an 850 or P:R: device and driver and run two cables to
the PC: the SIO2PC cable for emulating disk drives, and standard RS232 cable

for connecting the 850 or P:R: device for serial terminal interface?

Thanks for the info, Eric.

Phil

The short answer: Yes.

The long answer:

Yes. I'm not an expert, but here's the way I understand it (greatly oversimplified).

IP (Internet Protocol) defines how you address packets to nodes in the network, how you include data in the packets, how you verify that the packet was not corrupted, and probably a few other things. IP is responsible, I think, for routing packets to their destination. IP does not guarantee that packets will arrive at their destination, or that they will arrive in the same order they were sent, or that they won't be duplicated.

TCP (Terminal Control Protocol?) sits on top of IP and takes care of ensuring that packets arrive at their destination, that they are recieved in the same order they were sent, and that there are no duplicates.

TCP (and all the other protocols I'm familiar with) adds the concept of ports to the IP addressing scheme (where an IP address is a four-byte number usually expressed in the dotted-quad notation). To use TCP, you request a connection to another IP node (host) at a specific port number. You also specify the port on your machine that the other machine should reply to. When the connection is made, the remote machine specifies the port it has allocated for the connection (which will probably be different from the port you originally specified). Once the connection is made, you have what amounts to a fairly reliable virtual point-to-point serial connection between your machine and the remote machine.

A web server listens for TCP connections on TCP port 80. When you connect, the server assigns a different port for the connection so that it can continue to listen on port 80 for other connections.

Once you connect to the web server via TCP, you talk to it using a fairly simple serial protocol called HTTP (hyper-text transport protocol) to fetch documents.

FTP (file transport protocol), telnet, smtp (simplified mail transport protocol), POP (post office protocol), and IMAP (Internet mail access? protocol) also sit on top of TCP. There are quite a few other protocols that use TCP, which uses IP, so it's commonly globbed together into TCP/IP.

There is another protocol that allows machines to send IP packets over a serial line, called PPP (either peer-to-peer or point-to-point protocol). In that case, you have TCP/IP sitting on top of PPP. PPP takes care of things like negotiating what parity, data bits, IP addresses are used, verifying the identity of the machines at both ends, determining whether the connection is still there, etc.

So, if you want to dial into an ISP without a shell account, you have to implement the TCP, IP, and PPP procotol layers on your machine. Then you need to implement your application with HTTP to talk to a web server, FTP to transfer files, SMTP to send mail, POP or IMAP to fetch mail, and telnet to log into remote shell accounts. (I think telnet uses straight TCP, with a pseudo-terminal program being spawned for each connection at the remote host)

The biggest problem I see with implementing the entire protocol stack on an 8-bit machine is the amount of memory required to implement the TCP layer. You have to allocate buffers for each packet that arrives, and if they arrive out of order (or missing), you may have to hold quite a few buffers before you get them in proper sequence. You may be able to toss the buffers and request them to be re-sent later, but that could end up being a big hit, performance-wise, especially over a serial (PPP) connection.

I'm thinking it might be reasonably easy to design a serial protocol for opening, closing, reading from, and writing to TCP connections through a serial line between my Linux box and my Atari 800. Let the Linux box take care of the lower-level protocols. This is essentially what the C64 package does, except it also puts the HTTP handler on the remote machine, and the remote machine converts HTML documents to the same format the C64 hypertext application uses for local hypertext files. This is somewhat more limited than what I'm thinking of, because it doesn't appear to support the other protocols I've mentioned, unless you find a web server that implements those protocols for you (like a web-based mail browser).

Bet you're sorry you asked, huh? ;-)

Regards,
Phil

3533. FS/FT/For Free Atari 8 bit Items

Newsgroup: comp.sys.atari.8bit
Date: 2001-06-13 02:00:00 UTC
From: C Schell <schell@san.rr.com>
Message-ID: <3B26C900.8C4A3F58@san.rr.com>

Hello all,

Here's some Atari 8-bit items that I have and don't want. If you're
interested in anything make me
any offer.

Atari 8 bit:

1 XEGS Complete in Box
1 Atari 800XL with Power Supply and Atari Dust Cover
2 CX85 Keypads
1 Ardy the Aardvark box (only)
1 Threshold box (only)
1 Atari 400/800 Operating System Source Listing
1 Atari 400/800 Technical Reference Notes
1 (Smashed) Dreadnaught Factor Box (only)
1 (Smashed) River Raid Box (only)
1 Atari Basic Quick Reference Guide
1 Atari Disk-sized Reference Book
1 SAMS Programmers' Reference Guide
1 Atari 400/800 Personal Computer Manual
1 Fight Night Disk, "Box", and Manual (Box is like a folder)

Please respond via email. Boxes are free except for actual shipping.

Thanks,
Chad

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

OTHER USENET NEWSGROUPS:

Yes, this is certainly possible. I believe that APE already does this, but
that's completely windows bound. Yes, the P:R:Connection adapter and the Atari
850 are SIO to serial/parallel interfaces. You can hook up standard
centronics printers through it as well as RS232 serial devices.

> And CIO is the name of the protocol for talking to a serial device?

CIO is a higher-level interface. I believe it stands for Central Input/Output.
It is built on a lower protocol called SIO (Serial Input/Output). I have
more information about both in some of the old books I've got. Each SIO
command consists of some standard information, and part of it is a one-byte
command and a one-byte device number, and the RS232 device has its own code.
I'd have to look through my manuals for more details, but it seems like a
very easy thing to look for on the PC side, especially if you already can
catch and interpret the calls to the D: device (the floppy disk).

> Or I'd have to pick up an 850 or P:R: device and driver and run two cables to
> the PC: the SIO2PC cable for emulating disk drives, and standard RS232 cable
> for connecting the 850 or P:R: device for serial terminal interface?

Yeah this is possible too, but rather unwieldy. But if you already have
a P:R: connection or 850 and two free serial ports on the PC, then it would
probably be easier to configure on the Linux side, since you don't have to
write a program to route text going through the SIO2PC cable to a console
window, and there are already ways to tell linux to watch a serial port for
login.

> Thanks for the info, Eric.

You're welcome.

The short answer is no.

The longer and more completely accurate response is provisionally...

You still need an Atari type floppy controller. The Atari and compatible floppy drives contain an internal controller card capable of interfacing up to 4 drive mechanisms. Black Box Floppy Boards, Percom master drives and the ATR-8000 all permit easy access to the controller for connection of standard drive mechanisms. There were some other lesser known aftermarket suppliers like Corvus and Astra who also sold these types of circuitry.

>acotteau@aol.com (ACotteau) asked:

>hi ! I would like to know if i can use 5 1/4 disks on my atari XE

Experience is something you don't get until just after you need it.

Source record: 36269

They were considered fully tweaked out at 48K contiguous RAM; 64K address space with a 4K gap at $C000 and no RAM under the OS from $D000 to $FFFF.

They were kind of flexible with user accessible slots for memory cards; originally came with 8K and the largest mod I saw was the 1088K 800. Anything over 48K was a banked situation requiring special hardware and/or software to utilize it.

>"ColinR" colinr@ntlworld.com asks:

Hi,

> C? On an Atari?

Well, cross-compiled using CC65, but Elite
is written in assembler and built using CA65
to assemble it to position independent object files
which are then linked using LD65.

> How much ram does an Atari 800 have? Not enough, I'll wager.

The demo started out using page flipping but the performance
isn't so good and so I reverted to the XOR redraw method.
In theory the demo could work in 48K but I left in the display
flipping code to prepare the other screens and display them
when they're ready. The full game with all the objects and
extra code will require an XL/XE. Presumably bank switching
carts aren't possible on the 400/800s?

Regards,

Mark

3549. [Epyx Shrine] Summer Games

Newsgroup: comp.sys.atari.8bit

Message-ID: <3B2877A3.762D527@nexgo.de>
Source record: 36274

Hi there!

The Epyx Shrine (http://home.nexgo.de/cybergoth) now features an additional page about Summer Games with three interviews, one with Scott Nelson who worked on the C64 version. There's more interviews about the game in the pipe...

The Hiscore section is updated and now awaits your Summer Games Scores.

This was the last Atari 800 game that is featured on the Shrine. Now I'd like to know if I should post future feature notes about 2600/7800/Lynx/ST games here too, or are people interested in that all reading
news://rec.games.video.classic and
news://comp.sys.atari.st ?

I'm still searching some friendly guy with both a scanner and and Epyx catalogues from Fall 1985 or from 1986. Can someone provide complete+readable scans of such treasured items?

Greetings,
Manuel

The Summer Games page already features an interview with Peter
Engelbrite, who worked on the VCS version :-)

> And there are other vendors like Microprose, Electronic Arts, Broderbund,

There's soooooo much more work with Epyx games to do first :-)
It's just sad that they stopped doing Atari 8Bit games in the mid 80's.
I wish they'd done at least Winter Games.

From: bo snyder <bobo_snyder@hotmail.com>
Message-ID: <B74DF94D.72F0%bobo_snyder@hotmail.com>
Source record: 36277

hi all,

i finally got myself a xf551 drive. :-). it works great.

now my question is what upgrades should i do to it? and also what atari dos's support the full capicity of the drive (i did not get dos xe with it.. it came with dos 2.5).

can i put a 720k 3.5 inch floppy in it? (i am pretty sure i can't put *any* high density floppys into it).

it looks like it takes a standard ibm compatible floppy cable assy. can i put a dual floppy ibm cable on it (with the twist in it) and use 2 floppys with it, like a 720k and the 360k?

basically i would like to know the limitations of the drive and what kind of upgrades can be done to it, both lowbuck and maybe commerical upgrades.

thanks
bo

The left cartridges are same for all the models. Thus bankswitching is
model independent.

You may want to start off doing something about the SIO connectors. It could be as simple as pluging SIO cables into them and *NEVER* remove them or flowing a little extra solder onto the connections and using nuts and bolts to secure them.

I can't stress enough how lousy the circuit boards and soldering is on an XF551. Everyone I have ever seen fail was because of the solder joints on the SIO cable breaking loose and/or the circuit board cracking at the connector. The PC board seems about as sturdy as a cracker with finger nail polish on it.
>
> can i put a 720k 3.5 inch floppy in it? (i am pretty sure i can't put
any
> high density floppys into it).

Yes if you get a replacement rom or burn your own. Only a 3.5" 720k is a sure bet. I have done a 720k 5.25" but I don't reccomend it; requires a beefier power supply. You can put a 3.5" in there w/o the ROM modification and just use it like a 5.25" 360k.

IIRC the ROM is soldered directly to the PC board and the existing 34 conductor cable has to be replaced. You have to be very careful removing them.

If you add a switch. I did this too with a 3.5" drive/case<from a ST drive> mounted on top of the existing XF551 case, but I don't reccomend it. The manual switching is a major pain. Better solution is to get any other Atari drive, even an 810, and use that as drive 1 for booting software and compatibility and just use the XF35 as storage.
>
> basically i would like to know the limitations of the drive and what kind

of

Bob Puff used to do upgrades, don't know if he still does. Problem with sticking to much stuff in the XF551 is a terribly weak power supply. All they did for the 12V was use a 7812T which is a 1.5 amp device. The 5V supply isn't exactly overkill here either. The lower power 3.5" drives are a good thing, but multiple drives or anything that does more then sip power is a bad idea w/o beefing up the power supply.

I was acutally thinking of taking the xf551 motherboard and modifying one of my spare external scsi cases. i have a couple full height 5 1/4 scsi cases with fairly beefy power supplys. i was going to modify the back of the scsi case to make holes for the ports on the motherboard and then i was thinking of mounting the motherboad using standoffs or something to the bottom of the case. (maybe i should cast the entire motherboard in a block of acrylic that way the motherboard would never break/crack! LOL) then i was going to use the main powersupply button to turn on power to the floppys themselves, then turn on the regular power switch for the actual motherboard itself.

now how do i hook up the switch? i realy like the idea of having both a 720k 3.5 inch floppy and a 360k 5.25 floppy or even just a 360k 3.5 floppy and a 360k 5.25 floppy. that way i could have the best of both worlds...

Bob Puff. I have heard nothing but good things about his upgrade. I don't know if he will still do the installation of the upgrade, something you might want to consider if you want to be 100% sure you will end up with a working drive.
<snip>

I cheated badly. Just used a DPDT switch on the 5V and 12V supplies going to the individual drives. There was enough room to mount the switch inside the case so I could flick it from the front.

ahhh okay.. so basically you just had a straight though 34 pin ribbon cable
(no twist) with 3 ends on it (one for m.b. and the other 2 for the other 2
drives) and then when you wanted to switch, you would shut the computer
down, then flick the switch which would then enable one or the other drive
and then power the computer back up.. right? you wouldn't see both drives
in dos, but at least you could use both the 3 1/2 and the 5 1/4 right? :-)

thanks
bo

I treid and tried and tried (repeat MANY times) to get one and in the end gave up and bought a C64 with a DD because slow Atari tape was annoying me. I have one and a half (ie a broken spares unit) now. Sorry I know - but I was young, ask me what machines I collect now and which I remember with much fondness ;)

Does anyone have the a scan of the manual or owner's guide (or even a guide they could let me borrow to make into a PDF ? I never saw one.

Cheers

Paul

Hi Manuel,
Nice site! I would like to see scans of the boxes, carts, manuals and such added. Also the Epyx catalogues that you are collecting, I didn't see them on your website either. I think people would like to be able to view these old catalogues as well. Also it would be neat if you could add advertisements for Epyx games from old gaming magazines. I found a Epyx catalogue from 1987 I think, I'd have to check.
I also found a Pitstop cart for the Atari 8-bit that's in some generic case with a production label, that's on eproms. The label looks like it could have been added later,and is the same size as a normal Epyx label. I also found the instructions with this cart. Have you ever seen anything like this?

I put some pics up incase anyone wants to see-
http://www.angelfire.com/games3/johnstradelist/pitstop.htm

Hi

As an avid Bounty Bob fan I've just come across a german language site (http://www.skill42.de/makl/miner.htm) which mentions another game by Bill Hogue staring Bob called Scraper Caper. The scanned flier states it was available for the 5200 and all Atari home computers.

I guess this never made it to the UK, did it ever really exist ?

.atr anyone ? (or even better a mint original boxed copy for sale ;))

Bye

Paul

I saw ads for "Scraper Caper" in Analog etc., but I was never able to get or even see the actual game, even in the US...

Was it ever released?

As far as anyone's been able to determine, no. It may or may not have
been worked on, but the rumor is Bill just packed it all up at some
point, and Scraper Caper was no more.

Usually, my first place to look for files is at
umich:"http://www.umich.edu/~archive". Not the newest, but a lot of stuff. And
I have links to a few more places on the web. I am sure someone will post or
direct to you to a big list.

Hey all,

I'm trying to look for some home-brew projects for my Atari 8-bit boxes, like ram upgrades, IDE Interface (If it ever came out), and other projects, or a sio2pc project but I also use linux here.

I just watta get these back out and play =)

Looks like my Action and Mac65 carts are gone so if anyone has one forsale please let me know.

Also like to say "hellllllow" to Tom Hunt and Bob and Steve from kproducts =) and if any of the old schoolers BBS Pro ppl are still around =) oh and Michael Current for keeping the group alive =)

Keep up the great work!

3572. Koronis Rift: location of hulks?

Newsgroup: comp.sys.atari.8bit
Date: 2001-06-15 07:36:55 UTC
From: Lorenz Wiest <Lorenz.Wiest@dlr.de>
Message-ID: <9gcdul$t5o$1@news1.wdf.sap-ag.de>
Source record: 36296

Hi all,

I was wondering if someone could help me with the following problem:
recently, I found on the KORONIS RIFT disk the 64 x 48 grid point maps for each of the 20 game levels. Now, I remember a posting to this group some time ago in which someone said that the locations of the hulks (abandonned space ships you had to loot during the game) are also encoded into these maps. Since the level maps I found are bitmaps (set bit = mountain, cleared bit = valley floor) there seems to be no way to encode additional information.
So, does anybody know where or how the locations of (supposedly eight) hulks on each level are encoded?

Thanks for any help -- Lorenz

Seriously?

RAM = Random Access Memory

It's the chip based storage media that the programs use to run in.

Most people know it these days as DIMM's for the PC although it's still RAM
in a different package.

Thanks for that guys.

Going to over to the sates later in the year (Chigago propberbly) and then to toronto for a mates wedding. I was thinking of raiding any of the 8-bit suppliers in the area. for that one and an atari modem (plus some games :)). But had a sudden thought that me and a couple of fellow atari nuts could never remember seeing one over here.

I am aware of the shoddy PCB in them so will proberbly carry it as hand luggage or very well wrapped in clothes etc :)

Yes it did, I bought one from Silica in London, sold it, and later bought
back the same unit at a local car boot sale, came full circle. I don't think
they were very common though.

:-)

Except for the power down part, I would hot switch. Foggy memory now; I
think Sparta DOS automatically gets drive configuration everytime you access
a drive and MyDOS can be set w/o a cold boot by using the set drive
configuration.

Makes it just a bit easier to move files, copy to ramdisk from 5.25", flick
switch and copy from ramdisk to 3.5".

Hey ZaXXoN;

The ATR8000 arrived today in the Mail UPS 'THANK YOU'. Only one question do you happen to remember if you have any of the boot disks for CP/M emulation. It is up and running but I haven't tried to add mixed drives yet. I want to get the ATR boot disks or just the programs themselves to configure the ATR8000 to initialize and run the software on a high density drive like a 1.2 Meg PC 5 1/4 floppy drive set as drive one.

If anyone else in the group can answer this question, I would be grateful. I have downloaded the ATR8000 Manual from Atari History archives, and verified all the setting, and jumpers.

I also read in one of the recent posts to group and some one had commented about an add on board that would drive a hard drive. Does any one Know for sure if this is possible.
Also I would like to get a Co-Power 88 board if any of the ATR8000 owners reading the news group would like to sell theirs, or know of any where to get one, (i.e..) Ebay, Etc....

TIA from a new ATR8000 owner.

RoyE..

> I've read that the Atari 5200 was the same as the Atari 400 computer.
> However, were the cartridges compatible between the two?
>
No they're not exactly the same as one another. The 5200 was considered a
stripped down version of the 8-bits. It used some of the same chips, and
alot of the games play exactly the same on both systems. That's why people
say they're the same.But they aren't compatible with each other. The 5200
carts are about twice as big as the 8-bit carts.

John

Hi Nigel-
There were/are some Portfolio clubs in Germany and the UK that can likely provide info about your cable problem. I have read that it is a fairly common problem. I have a few links that you might try:

http://www.geocities.com/SiliconValley/Vista/3015/portfolio.html#specs

http://www.jollyp.co.uk/index.html

http://www.palmzip.de/

http://gem.win.co.nz/mario/pofo/

http://www.sumo.clara.net/Port/index1.htm

Also, Best Electronics (California, US) has quite a bit of Portfolio stuff and is linked up with some Portfolio clubs. They are at

http://www.best-electronics-ca.com/

Good luck!
Larry White

Physically they are very different, but electronically very close; still the OS
was altered and so software is not interchangeable. Some ports were done of
5200 code to 400/800/XL/XE by a few very bright and diligent folk. An early
Analog printed an article about this possibility.

Thanks for the lead. After some searching I found Tom's CTH
(Closer To Home) website. There's some great stuff there.
I even logged into the BBS! Now I need to set up those ATASCII
fonts on my font server for the full effect. :-)

If you're refering to his PC-Gateway, I don't think that's
quite what I had in mind. As far as I could tell, it looks
like the Atari 8-bit end of the link just acts like a dumb
terminal.

What I have in mind it to create a socket API for the Atari
so the tools would actually be running on the Atari, with
the Linux (or any Un*x-like OS) machine just providing the
rest of the TCP/IP layers.

That way, you could write tools like ftp, wget, Pine, Lynx,
etc. that would be able to transfer data to other devices
on the Atari directly.

Of course, I'm a long way from being able to do that. I still
don't have a clue as to programming the Atari 800. I don't
event know how to use any of the DOSes at this point.

I think I saw somewhere a table of SIO command codes, but I
have to go back and find it again. They may have been only
for the disk drives. I need the commands for the R: device,
unless they are the same as the D: device (is that right -
D: for Disk)?

I know there is a limited SIO2PC program for Linux, which I
probably will have to extend to recognize the commands for
the R: device.

What else? Oh yeah, I need to get some tools together for
programming the Atari 8-bits. Preferably running on Linux
(assuming that will be more efficient than doing the
development on the Ataris).

I plan to make this code open source, so hopefully I won't
have to do *ALL* the work. ;-)

Also, I should make it clear that I have some other 8-bit
projects going, so this one may take a while.

Regards,
Phil

Hi,

I just mail this info to make sure everybody has atleast heard about it.

New game #1:

Mr. Proper, written by Alex from Bit Busters

Sikor Soft says "Now I wait for 100 person and speak with Alexander to
finished this project."

So it's up to us to reply when we want this game.

New game #2:

DOOM, written by Piotr Fusik (Fox)

Sikor Soft says "I also speak with Piotr Fusik (Fox) for doing "Atari DOOM",
DOOM version for little Atari. Final price is no knowing yet..."

For DOOM development is no price known but I think everybody who is
interested in will pay atleast $25 USD for it.

Please e-mail to Sikor Soft when you like to have a copy of Mr. Proper so it
will be finished and that the DOOM development will start.

Sikor Soft e-mail: sikor [sikor_soft@poczta.fm]

Just a note, IIRC you have to run a 1.2 meg 5.25" drive as and 8" 77 track
double sided drive with the ATR8000.

The ATR8000 figures out what is plugged in every time you press the little
reset button on the back.

Hi!
I live in Central Florida (Altamonte Springs) and although I've out grown my old 8 bit Atari, my kids still play with it! So now that my 810 drive stopped working, I figure it's probably cheaper just to buy another one, than to try to get the one I have fixed. Any sellers of a working 8 bit drive, please email me a.s.a.p. at themaingmaster@yahoo.com Thanks!
Joe

There are dumb terminal programs and smart terminal programs.

For instance, back in the 80s I wrote a terminal program for the 8bit that responded to text input from a BBS. It was just a small interpreter that implemented basic like commands for online games. Simple stuff like GRAPHICS(x), BLOAD(addr, size), USR(addr), POKE(x,y).
>
> What I have in mind it to create a socket API for the Atari

This is problematic because a lot of these apps think they are going to get an 80 column screen. I used to shell on Portal and waffle board a bit with my 8 bit and I didn't really like the results.

> I know there is a limited SIO2PC program for Linux, which I

Steve Tucker says the R: hander for the Rverter works with a SIO2PC cable. He was kind enough to send my the Rverter program but I never got around to testing it myself.

There is a problem or two with this such that you may want to consider: You can't find two people to agree on what language to program in.

I mean I used to do a lot of programming, even some targetted for commercial release. Used to do a lot of Ad Hoc programming too. Someone would say ~"I want an autorun program that takes user input to set up a joystick and returns control to the ..." and I would write it.

People that program in BASIC insist on BASIC. They will accept USR() routines on occasion, but that is about it an just an extra hoop to jump through. You tell them BASIC is to slow and they will say "Use BASIC XL" to which another will reply "I use Turbo BASIC" to which another will reply "I only have a 32k 400 and it won't run on my system".

People that insist on C because they think they can use the large C data base end up not being able to convert it because of implementation variations.

People that know how to program a bit in assembler have a snotty attitude. Try to get your average asm/ed "Hello Atari" programmer to touch a USR() for a group writing in BASIC and the insults will start as they will consider participating in any BASIC program beneath him.

Then there are people such as myself that think Action! programming language is the best compromise between speed and compatibility/readiblity. We represent maybe 3% of the programers.

I guess what I am trying to say is the only person you can count on to work on your programs will be yourself with few very exceptions.

Yes Doom is open source, but it would look more like Wolf 3D on Atari 8-bit.
It's called Atari DOOM so that people would directly know what kind of game
we are talking about.

It would be great when more people write to Sikor Soft, so that the game a
good 3D shooting up would be made...

Source record: 36228

It sure does. Thanks to Jindrich for reminding me of the following :

OK, there are some other simple cheats, but the "Big one" is this:
Go to the Options screen (with "Option" :-), and using your joystick,
set "special code" to 61800 (This takes a while, but it's worth it).
This only works immediately after starting the game!

Now hold down the letter "f" key and press OPTION again. So that's
F and OPTION together. It seems as if nothing has happened, but in
the game, you can use the following keys:

- Q : Advance one level
- A : Decrease one level
- B : original position
- Z : Same level again
- F : Float mode on: This one's great: If things get too hard or
impossible to play, just press F and float your way around the
screen.

How to jump to higher levels:
>From 1 (Bob's morning calisthenics) to 4: get the flower pot,
then press "1" and "START".

>From 2 (utility hoist) to 22: kill the mutants, get the paint roller
and then press "3" and "START".

>From 3 (suction tubes) to 15: get the goblet then press "4" and "START".

>From 5 (jumping 101) to 8: get the coffee pot, then press "8" and "START".

>From 10 (gravity lift) to 14, get the pitchfork and then press "5"
and "START".

>From 16 (Advanced Suction Tubes) to 19: turn arrow in suction tube #1
to the left, get the pie and then press "9" and "START".

I remember that there were other codes too. You could give him a haircut
(remove his hat) and other cool stuff. If anyone remembers the codes please
let me know.

Paul

Sounds ambitious.

I just fool around a little in Linux -- I never really have time to get into it as much as I'd like to. But I admire those who do. It seems like a much more capable OS than Windows, especially in terms of being friendly to development by an entire community -- not just those on the OS publisher's payroll. It also seems like it has great appeal to a somewhat DIY community of orphaned classic home computer users.

Take care, and thanks for the clarification.

3608. Re: Big Five's "Scaper Caper" ?

Newsgroup: comp.sys.atari.8bit
Date: 2001-06-17 15:50:01 UTC
From: jhardie@pipeline.com
Message-ID: <3b2ccee4.29514254@news.pipeline.com>
Source record: 36231

I remember when I first found the messages hidden in Bounty Bob. I
was intrigued to say the least. A buddy of mine who was a big time
hacker/cracker was convinced that one of the codes would probably dump
the game to disk. Don't know why he thought that but I was always
willing to entertain the idea.

Here's the codes I found over the years. Simply enter these numbers
and press "OPTION".

5
6
49
69
100
213
666
782
818
1000
2049
6861

One of these numbers gives you the "haircut message" and when you
start the game, Bounty Bob has no hat.

I never had time to go through all the numbers. I've always talked
about trying to start a Bounty Bob project where we could get a bunch
of people together to try different sets of numbers. That way it
would get done a lot faster. If anyone's interested in doing this,
email me. The only thing that concerns me is that I never would have
thought to hold down another key while pressing option. I wonder how
the 61800 code was found. I would think it must have come from Bill
Hogue himself.

Interestingly, the numbers listed above also work on the 5200 version,
except for number 1000. I wonder if 61800 works on the 5200 as well?

Well,

I don't think the Linux side should be too hard. I've been doing similar
things at work. Being clueless about A800 programming probably helps me
be optimistic about that end of it.

And yes, I'm having a lot of fun working with Linux. After spending 25+
years doing embedded 8-bit stuff, it's nice to not have to count bytes.
It's nice to have so many tools available too - almost overwhelming. I
have a lot to learn.

Of course, I'm getting right back into the byte counting and limited
tools with the Atari 800, aren't I? But now it's my hobby! :)

Regards,
Phil

Hi Tom,

If I'm not mistaken, DJGPP is a port of the GNU compiler to the DOS environment. I once ported a Winsock 1 program to Linux and there was very little to change except for some of the code to open the sockets.

So if you wanted to port the pc-gateway to Linux, it probably would be much easier than you think.

Of course, I don't know how many classic computer owners there are running Linux. I'm doing this for myself as a learning experience and for the fun of it.

Nice website, by the way. I do plan to check back into your BBS again.

There's a web site that can automaticaly translate for you. It's called
SYSTRAN. It's URL is:

http://www.systransoft.com/

You provide the URL of the web site you want to translate and select the
from/to languages.

Here's what it translate it to:

The follow-up play of Bill Hogue: Scraper Caper

After the enormous success of the Miner 2049'er and Bounty Bob strikes bake
made itself Bill Hogue to a new play named Scraper Caper. Roughly described
tried Bounty Bob probably as a feuerwehrmann and rushes about naturally again
Yukon Yohan:) Appeared it never officially, a Previewversion is it to however
naturally give:)

Thank you at Nickolas Marentes for the picture!

Glenn

Get Bob Puff's 3.5" Dual drive conversion for the XF551. You can have either one 5.25" and one 3.5" drives or two 3.5" drives. But make sure you use a separate power supply for atleast one of the mechs. If not, it will start dropping sectors in the wrong places (IIRC 52 tracks nearer to the center of the disk then it should). And while you're at it, install a power on LED. Just get one of these power cables that has the usual 5.25" power connectors and where from one of the connectors two thin wires (about 10 inches to a foot long) extend. Plug a LED with a small resistor (150 to 200 Ohms) soldered to one of it's legs into the small connector making sure you do that the right way around. (sorry, I'ld have to check which leg is plus and which is minus)

Connect this cable between the existing power cable.

B & C ComputerVisions sells them for 9.95
http://www.myatari.com/bc800hw.txt

Also
4 Jays has them for 10.00
http://www.4jays.com/atari8bit.html

Or try ebay. I don't know where you can get those wierd
square plugs, but I believe the wires would just connect to the same pins on
each side, if you were to make one.You really wouldn't need the pinouts to
make it. But the pinouts are in the FAQ page here if you want to see them.

Reply to my enquiry to Bill Hogue follows :

Paul,

Thanks for the kind words about Bounty Bob. It's really neat that there are so many people around that have fond memories of my old games.

Scraper Caper was supposed to be our next game after Miner 2049er. We had a lot of success with Miner and ended up licensing it for just about every computer that existed at the time. This put a lot of pressure on us to come up with something that was incredible and could duplicate Miner's popularity.

Our first cut had Bounty Bob at the base of a high-rise building on fire. He had gotten work as a fireman after finally getting out of the mines. (He had also slimmed down, if I remember!) The concept would have had the player controlling him throughout this building in search of people to rescue or items to save.

We had a large part of it programmed but it never seemed to go anywhere so we abandoned it. We started another totally different game that had Bounty Bob on this 3-D style maze with angry little fireballs after him. I spent a ton of time getting the look right so that Bounty Bob and the little fireballs would move in and out around the playfield correctly. What we ended up producing was a stunning looking screen masking dull game play.

So we finally chose to do what we should have done in the first place: make a really cool sequel to Miner 2049er and put Bounty Bob back in the mine. We had a tremendous amount of fun coming up with all the new levels and contraptions.

It's too bad but whatever code that existed for Scraper Caper I or II no longer exists. There might be some videotape somewhere. Maybe I'll try to find it one day and make it into a movie.

Thanks for your letter, Paul.

Bill Hogue

Bob Puff and/or Bob Woolley are the gurus for the 551 mods...

XE would be the only Atari DOS to support its capabilities. Aftermarket products include MyDOS and SpartaDos; both support DD and DSDD in versions 3 and up - not certain about 2.3?

Also TopDos 1.5 by Eclipse which refers to DSDD as 'quad' density. I do not remember if SmartDos or OSA+4.0 could handle double sided.

Capacity above 360K on the 3.5" mods likely require MyDos or SpartaDos.

I have not used nor had opprotunity to look at those systems, but most had 6-10
boot sectors and directory structure to manage the other boot data in the
sectors. I suspect a little digging with a sector editor might reveal how
simple it would be to extract that code to disk or cassette.

I seem to recall that most of the multiboot disks used the basic DOS II format - try installing a multi-boot ATR disk as D2: under Sparta or MyDos, then browse and copy files from the multi-boot disk.

I'M NOT WORTHY!!! That is so cool! You know Bill Hogue's programming predates the atari, I have a few of his games for my 1978 TRS-80 model 1. I think the ones I have were written around '79, titles would include- 'meteor mission 1&2','Robot Attack'- which had digitized speech samples that would holler at you" PLAYER ONE" and "GAME OVER PLAYER ONE", also there was 'Galaxy Invasion', and 'Invasion Force'. Even by todays standards these still have excellent gameplay.

> 7800

I know about this. The problem is, that I cannot present screenshots of
it, since I don't have the ROM image.

The only 7800 Epyx game I can do screenshots is Winter Games. I'll
present these, when the WG page is done.

Greetings,
Manuel

> Hi Manuel,
> Nice site! I would like to see scans of the boxes, carts, manuals and such
> added.

With the scans it's mainly a space problem. Let's assume I'd scan all boxes of all California Games versions made. That'd be at least 14 * 300K, which'd more or less *waste* 4 MB just for one game.

I'm thinking about doing some *special* scans though. Anybody ever seen the japanese cover of Sega Master System 'Summer Games' for example? :-)

> Also the Epyx catalogues that you are collecting, I didn't see them
> on your website either. I think people would like to be able to view these
> old catalogues as well.

That's definitely the next section to be opened on the Shrine. So far I've collected 5 catalogs ranging from 84 to 88 ready. (Older ones are already up on Mo's page) I just try to have them all complete for the grand opening :-)

> Also it would be neat if you could add
> advertisements for Epyx games from old gaming magazines.

See above. Maybe later. I'm thinking about a review section, too.

> I found a Epyx
> catalogue from 1987 I think, I'd have to check.

It'd be cool if it were one that's still missing in my collection. I already have an '87 catalog, but I don't know if there was a second. We should compare the contents.

> I also found a Pitstop cart for the Atari 8-bit that's in some generic case

> this?

I have a 100% identical looking cart with the C64 version of Pitstop. Only difference is that the Atari copyright is replaced with a commodore one. I haven't opened it though and I'm not gonna do it :-)

Greetings,
Manuel

3635. Re: [ANN] 8-bit Atari Elite Demo

Newsgroup: comp.sys.atari.8bit
Date: 2001-06-19 12:31:06 UTC
From: Andreas Magenheimer <magea000@mail.uni-mainz.de>
Message-ID: <3B2F460A.4307EE62@mail.uni-mainz.de>
Source record: 36109
Cross-posted to: comp.sys.atari.8bit,alt.fan.elite

Well,
I am one of those "original" atari 8-bit users and I have downloaded the Elite demo. Unfortunately the unzipped ATR had a length of 33kbytes, still converted it to single density and downloaded it to the XL, but: the demo is a little short !! I can only see the title screen, where a vector-graphic (and very flickery!) space ship appears. I guess the flickering comes from my PAL system (50Hz), allthough I have seen much better -flicker free- vector graphics in various commercial games (like Mercenary, F15-Strike eagle, thomahawk, fighter pilot, etc.) and polish demos (dozens of demos, to many to count!). Maybe you should use a vector routine, that works well on both NTSC and PAL systems...

Next, whenever I press any key (console button, keyboard) the demo crashes - or the rotating vector graphics stops and nothing else happens. the only thing I can do is pressing the Reset key and the vector graphic rotates again. But thats all. - Maybe your zipped ATR has some bugs (or my downloaded version has) ??? I do hope, that this demo version will not only work on an emulator, but also on the real machines. Unfortunately it doesn`t at the moment...

From: bo snyder <bobo_snyder@hotmail.com>
Message-ID: <B75498A7.7E85%bobo_snyder@hotmail.com>
Source record: 36111

okay i ended up at video 61s webpage. i went to the atari 8bit carts page and nothing.. i didn't see any cool info or anything about new atari 8bit carts. all i saw were 2 tiny lines that just had preppie and preppie 2 listed for 19.95 a peice. but you know, if these really are reissues with scott adams's blessing, don't you think you should make a big splash about it and all?

all i ever thought about your webpage was that you sold nib atari software. i didn't ever realize that you acutally sold brand new (not nos) or reissued stuff, etc.

don't be offended by my comments. i just never paid much attention to your page only because i thought you just sold the same atari 8bit software that other companies had. you might want to put scans of the carts in there and maybe little bits of history or info behind the carts (especially if they are reissues).

on another note, when is someone going to make a Multi-cart for the atari 8bit system???? they have one for the 5200 so one for the 8bit should be quite easy to make patterned after the 5200 one. and i bet their are plenty of basics available for use as donor carts. (don't tell me to try to make one, i have NO idea how to even begin!). i would LOVE to be able to play some of my disc games such as converted 5200 titles on my 8bit on a real cart. :-)

Well,
other DOS versions, that support the XF551 are SuperDOS 5.0 and 5.1
(from Australia), BiboDOS 6.4 (Germany), Turbo DOS 2.0/2.1 (Germany),
DOS-XF (Germany), X-DOS (Germany) and maybe a few more. You know, former
eastern germany atari users had a tape recorder - or the XF551 (the 1050
was never officially sold in eastern europe!). Thats why there are so
many german DOS versions for the XF551 (all of them limited to
360kbytes!). -Andreas

Thanks for sharing that response you got from Bill Hogue.

I was a huge fan of his when Big 5 produced TRS-80 games. I considered
his games were the best games ever produced on the TRS-80. Meteor Mission
was my favorite game.

The first game that Big 5 produced was Super Nova. A asteroids style game.

You compare Super Nova to his later releases, the programming and graphics
done significantly got better and better.

I sure hope he can find that tape!!

Well,
using MyDOS 4.5x with a PAL XF551 (with an Eprom OS!), the DOS always
sets the density right, allthough the XF normally cannot configure the
density automatically. MyDOS has an option ("P") to set the density to
single or double, but equipped with the XF551 I never needed to use this
option. -Andreas

Source record: 36115

Well,
at the "Atari World 1999" (or was it 1998?) someone gave away flyers and stickers of DOOM avaiable for: Atari VCS 2600 and soon avaiable for: ColecoVision, IntelliVision, Atari VCS 5200, Atari VSC 7800, Atari classic, Atari Lynx. I also found some scans of these stickers/flyers on the SAGE atari CD-ROM. The stickers had an email adress on it - tried to contact this person, but the email is no more... So, anyone heard or seen these adverts ??? Especially is there anyone who was at this gaming expo and maybe spoke to the guy who gave away these adverts ??? And finally: were these versions or at least one of these versions ever released ??? -Andreas

Two problems:
1) Too many cartridge games (cca 5MBs)
2) Real cartridge dumps are needed. When I asked in this group for
cooperation, nobody replied. (http://www.asw.cz/~kubecj/acartdp.htm)

hi bo,
we try to keep the page simple because many actual atari8 user still
access the pages, and all of the fancy stuff means that they are locked
out.
many xe carts are bank selected, and very large in memory compared to
the 5200, so what you are asking for is something that will be hard to
do.
thanks,

Atr's under the emulator don't appear to be required to a fixed size.
The remainder is simply 0's but I'll make the atr 96K next time.

> still converted it to single density and downloaded it to the XL,

> vector routine, that works well on both NTSC and PAL systems...

Mercenary uses page-flipping to achieve the smoothness, I've tried
this but reverted back to the original game's XOR redraw method.
The main reason behind this is that I need to get the main game engine
working first before I can see how to incorporate the page-flipping.
I'll try it again later, but for now this slows the rotation speed down
the intro screen compared to the C64 original. I'll also try leaving
the undraw pass until the vblank to see if that helps the flicker.

> Next, whenever I press any key (console button, keyboard) the demo
> crashes - or the rotating vector graphics stops and nothing else
> happens. the only thing I can do is pressing the Reset key and the
> vector graphic rotates again. But thats all. - Maybe your zipped ATR
> has some bugs (or my downloaded version has) ??? I do hope, that this
> demo version will not only work on an emulator, but also on the real
> machines. Unfortunately it doesn`t at the moment...

The instructions did say use the Start key ;-)
I'm afraid I did put in a replacement key handler routine since I've swapped
out the OS. When I'm back from my hols I'll set up a web page and re-release
the demo with the key-press fixed and page-flipping enabled as a comparison.

Regards,

Mark

P.S. I've made a loading screen from the C64 loading screen
but if anyone can do a front-on logo...

> above. No luck either.

Well, in fact this server has very slow transwer

Because I place ALL text of invitation, so that you would
be able to get to know. Nice readings!

PS.. Fox-1 On party on 100% you will meet some Jurgi/Tristesse
- you remember him?

Vasco/Tristesse

- -
Lato Ludzikow (People's Summer) 3
August, the 3rd-5th, 2oo1
Taklamakan, Opalenica, Poland
ATARI Copy Party
Invitation
- -

What everyone guest has to know...

It's third edition of this party, and (both with
winter 'Last Party') it is seventh party in this place
allready! Sincethe famous QuaST party has dead,
parties in Opalenica ('Last Party' on December &
'LL' at summer) became the most important Polish
Atari fans party. It's dedicated to all Atari users:
ST, ST(e), TT, Falcon, and of course XL/XE.
I must notice, that it is NOT a commercial party.
No one will get a profit of making a party. A money,
you will pay for enter, is only for renting a place
and for praizes.

Yes, but what is the cost of it?
We live in a kapitalistic country, and no one will
give as a place for free. That's why we have to pay
40 zl (it's about 20 DM, I think, that is not much for
people from western Europe).
We know, that (for a difference) a trip will be
very expensive for people from ex-communist
countries, that's why, if you are from: Czech,
Slovakia, or ex-USSR (like Latvia, for example),

you may enter FOR FREE!!! You can bring a good beer
for organizer if you want.
Of course (because we are not feminists) women
always enter for free! So You can take your girl/wife
with You with a not much cost.

When?
Party will be at the first weekend of August
(just like the QuaST party). It means from the 3rd
(Friday) to the 5th (Sunday). Official opening will be
on Friday, but You can arrive on Thursday's
afternoon - party place will be open, and some people
will be there allready, I think. Official closing is on
Sunday about noon, but You can stay on party place
to the late afternoon.

Where I have to go?
As it was said, this party takes place in Poland
(Poland is in Europe, betweem Russia and Germany,
if you are not good in Geography ;-). A small city -
Opalenica is at west from Poznan city (Posen),
near west border of our country. All trains (without
Express, IC, EC) from Frankfurt/Oder (Germany)
to Posen are going through Opalenica (just look
for yellow train station).
Party place is (as always) in City Culture Hause,
called 'Taklamakan'. How to get there from the station?
It's about 800 meters long walk. You should go along by
'Dworcowa' street. At it's end (where is railway crossing
at left), turn right to the '5-go>Stycznia' street. At next
crossroads turn to 'Powstanca Kozaka" st. Walk ahead 100 meters
and turn right to 'Farna' st. At it's enf you will see
city-hall. Then turn right, and left to 'Mickiewicza' st.
About 50 meters later You will see so long awaited
'Taklamakan'. Hurra!
If You think, that's a bit complicated, I have
a good information. Probably always someone will wait
for You at railway station!

What should I expect at this Takla...?
* A big show-hall where You can put your hardware
(or see others' one). This hall has a big scene
for Atari Scene ;-).
* A separate sleeping-room.
* A pizzery in the same building.
* A shower (wow, great!).
* And (the most important!) a lot of famous Atarians!
And great Atari hardware.

You can also expect competitions (music, graphic,
intro & demo). Bring your own production to participate

in competitions!
You should not expect a comfortable beds, so
take your own sleeping-bag! You may take your hardware
(don't forget about monitor, cables, etc).
Probably we will also make a camp-fire one night
(yes! in the city!) to roast some sausage and talk to
the morning.

Competition rules (XL/XE)
Some general notes:
- There's have to be not less that 3 works to make
the competition.
- In the case of very many productions organizers
will do a selection.
- A compo-work has to be described in DOC file
(a kind of competition, name of work, author(s),
adress).
- Author don't have to be on party (it means, that
You can bring your friend's production if he can't
arrive), but in this case author will not get the
prize (if he win of course!).
- All competiton works are freeware!
- All participans will be in Jury.

Music compo:

- Plaing time is 3 minutes max. Longer tracks will be
turned off.
- It must be your original composition (it means:
no 'convertions', no 'covers'!!!).
- You can use someone elses' samples or
synthwaves, but You should describe this in DOC file.
- Track must not be a *.COM file!
- Allowed formats (composers):
- Chaos Music Composer (CMC),
- Music ProTracker
(MPT, MD1, MD2 + SMP),
- Theta Music Composer (TMC).
- All tracks will be played with MacGyver's
Mega Player 1.6 or 2.1.
- Music will be played in stereo!
- Music can be in other format, if you bring
a player & composer, and organizer will agree!
(Using extra memory for music compo is not allowed!).

MOD compo:
- Only *.MOD format (known from Amiga 500).
- Max module length 170 KB.
- One sample may be 32 KB, rest only 16 KB.
- Tracks will be replayed with Inertia
Player 4.1/4.12/4.5.

- Tracks will be replayed with 4-channels
8-bits music card (freq. 11.5 kHz).

Graphics compo

- Allowed formats: MIC, PIC, GR8, GR9, CPR, INP, INT,
XLP, CIN, HIP.
- Another formats may be allowed if the painting
program is available for every one (for example
PGR) - but organizer has to agree.
- Converting from other computers and scannings
are not allowed. Picture must be done on Atari!
- Redrawing someone else's pictures is not allowed!
It must your original work!

Intro 256 B compo

- Maximum length of code is 256 bytes,
but one dos header and one run/init
vector will be not included in counting.
- Intro must not use extra ram (it must run on
64 KB mashines).
- Intro must run from DOS (MemLo not higher than
$2000), but it doesn't have to back to DOS.
- Sound (if someone can put a music into) will be
in stereo.

Intro 16 KB compo

- Maximum lenght of file is 16 KB.
- Intro must run on 64 KB mashines.
- Intro must run from DOS (MemLo not higher than
$2000), but it doesn't have to back to DOS.
- Sound will be in stereo.

Demo compo

- There is no limit of maximum lenght.
- Demo must run with DOS (MemLo not higher than
$2000), but it doesn't have to back to DOS.
- All callings to disk must be with 'D:' device only
(not 'D1:' !!!) - it's because it must run from
subdirectory and/or HDD.
- If demo has some effects during loading,
it must not use RAM under FPP area -
it's because it must run from HDD.
- Demo can use 320 KB of memory on PortB
(+256 KB). It cannot use separatelly acces
for Antic/CPU (like 130XE or Compy Shop).
It means both Antic & CPU must use ramdisk
together (another explanation: an acces
like: Antic - extra ram & CPU - base ram
is not allowed) That's because demo must

run on every kind of RAM upgrade.
- Another RAM upgrades are not allowed to use
on competition.
- There must be an option to change used memory
banks! It should be a kind of setup with all
possible 64 banks to select!!!
- Sound will be in stereo.

Ending words

As far as I know that was all a gag. The only thing is, I only know
about the 2600 "version", and that was just a photo hack. The image
was made by James Catalano, though lots of other people have taken
credit for it... The original newsgroup publicity was by Bill
Haslacher, an ex-Atarian and kidder.

Message-ID: <20010619212311.29844.00000159@ng-fx1.aol.com>
Source record: 36123

Hi David;

Even if the files are available from DOS, they are still boot programs rather
than binary load executables and will require some massaging to be usable
again. You must either add load and run vectors or convert them back into boot
disk/tape format.

>david_p@istop.com (David A Paterson) responded:

>I seem to recall that most of the multiboot disks used the basic DOS II
>format - try installing a multi-boot ATR disk as D2: under Sparta or MyDos,
>then browse and copy files from the multi-boot disk.

-Ron

Experience is something you don't get until just after you need it.

AM> and 5.1 (from Australia), BiboDOS 6.4 (Germany), Turbo DOS 2.0/2.1
AM> (Germany), DOS-XF (Germany), X-DOS (Germany) and maybe a few more.

Interesting. I have a DOS disk from "Top Magazin" which is just labeled as "XF Tools". As the screen is in PAL, it runs a little long for my NTSC monitor. I wish I knew what it is. The DOS makes a popping sound like a popcorn popper or a machine gun/pistol when it loads. I don't speak German, but it looks like some sort of DOS disk, the loading sound is different from Bob Puff's "ultra skew" used in Discomm. I'd love to know how to use it, or at least how to identify the disk DOS header / ID byte....

No total rewrite. SoF is written in BASIC. There's a little ASM part
which is intended to speed up the dungeon creation, but this should be
easy portable too.

I'm sure if you ask in comp.sys.cbm somebody can tell you how to extract
the BASIC listing out of an *.D64 image.
Maybe I could then help reverse-engineering the ASM part.

BTW: Does the Text resolution of the Atari and the C64 match? I think
the C64 uses its full 40*25 char resolution for Sword Of Fargoal.

Greetings,
Manuel

Howdy folks

I found this in comp.sys.cbm (the C64 group). Sounds like a fun project for somebody with an Atari 8 bit and a GSM telephone. (GSM is a standard for mobile phones. SMS stands for Small Message Services. You can send small text messages from one GMS telephone to another. I've heard of plans to make SMS possible on 'fixed' phones too.). I don't have (nor want) a mobile phone.

2600 Doom, eh? It reminds of the story told by the 2600 programmer
whom Atari approached about the graphically intense scrolling
shoot-em-up Xevious. I think he said something like "Well, I got the
assignment and had no idea how I could possibly do that on the crude
2600 system, so I sat on the sofa and smoked about 4 marijuana
cigarettes and then I knew how to do it."

Hee hee! I am not defaming anyone as a pot smoker, but that is the
story I remember.

Wolf- "wolfenstein 3d" was John Carmack and John Romero's first entry into the computer games market, after that they rewrote it into DOOM- which has become a standard of measure for alot of todays 3d first person shooter games. They went on to form their own software company called ID-software. They created "Quake" and the quake engine which is used in alot of todays PC games. Usually they are just "Quake" with the textures and graphics swapped out to create something new.
Here's the link to their website-
http://www.idsoftware.com/

Honestly, I've never touched a commodore. I downloaded an emulator this evening and have been getting familiar with it, I ran Sword... and it looked pretty good. The text res. looked very similar to the atari's I'm working on getting a printed listing of the prog. I noticed on comp.sys.cbm that somebody else is trying to defeat the copy protection of the game and I refered them to your site and the links to the authors webpage. I'll keep you updated and I'm definitely going to need help with the asm code. Thanks,
Mo

This is interesting. Did a search on Google.com for Miner 2049er and found a Atari easter egg list for Atari's. They had some of the cheats for the 5200 version of Miner 2049er. Here is what they had:

Area select:

Begin game play and jump on the first platform. Place Bounty Bob in a position where no opponents can touch him without pausing game play. Hold Top-Fire and press 2, 1, 3, 7, 8, 2, 6, 8, 6, 1. The level will restart to confirm correct code entry. Press Reset followed by a number that corresponds to the desired zone. Note: Press 0 for zone 10. Then, hold Top-Fire and press a number that corresponds to the desired station.

Unlimited lives:

Enable the "Area select" code. After losing a life, immediately warp to another station to keep your current number of lives.

They have all kinds of other easter eggs for Atari systems. Here's the link:

http://www.gamegenie.com/cheats/atari.shtml

here might be the "killer app" for upgrading to the 65816 (i think thats the number) cpu. you know, the 16mhz 6502. :-)

it has very little support as far as software goes other than some demos and stuff, but doom for the atari 8bit? i would do some soldering into my machine just so that i can play doom or castle wolfinstein (the 3d new version, not the orginal version!)

i don't know.. i just don't think that doing such an upgrade without a REAL games is worth it to me.

hi all,

does the chris crawford (i think) game "scram" come as an downloadable atr
or binary image which is transferrable to floppy and/or playable on a
emulator?

i would love to play this game again. my dad and i used to have a lot of
fun playing that thing, but i remember it was on cassette and what a pain it
was to load.

thanks
bo

3664. Re: Seikosha Printers for Atari

Newsgroup: comp.sys.atari.8bit

Source record: 36139

I have a gp550 and had tried to convert it to a standard "ascii"
printer. There is a 65xx or 68xx (can't remember exactly)
controller/cpu that would need to be changed/reprogramed to make it
work on another computer. Hope that gets you a little closer to your
goal. I found it not cost effective to bother on mine.

Anyone want a Seikosha GP550 for an Atari??
worked last time I power it up (5+ years ago)

Source record: 36136

They did make a multipak interface for the TRS-80 Color Computer, it allowed four cartridges including the disk controller to be plugged in simultaneously. There was both hardware and software switches, the only drawback is that only one cart at a time could be used with the disk controller. It might be possible to duplicate this and port it to the 8bit. it would also possibly allow a 35 track double density drive to be added although that would definitely be tricky. The COCO, in case no one is familiar uses a cartridge disk controller with a cable attached to the disk drive. There were other carts made for this unit as well, like an RS232 cart, Direct connect modem cart, speech synth. cart, and a music synth cart.
Just thinking out loud again,
Mo

well there is the vauge possibility, and lots of talk of something 'doom like' appearing on the atari-8. Though it would be more a wolfenstein type of affair. Examples of games that got close are 'capture the Flag'(look), Mercenary (game play) and 'Alternate reality'(a mix of both, but felt 'turn based') It may be that there is the possibility for setting up a first person, full perspective arcade shooter on the 8 bit. But I pity the poor poor processor. The Amiga Struggled to emulate doom, I'm sure that the Atari 8 (spiritual farther to the Amiga) would be even less capable. But I am constantly supprised at what peeps can get out of old kit.

It's a BASIC program. At least the copy I have is. Got it back in about
1982/83. It's a 13K file. I'll put it up at umich if it isn't already
there.

3669. Open Projects for the Atari

Newsgroup: comp.sys.atari.8bit
Date: 2001-06-21 00:04:04 UTC
From: MUD <gary@spam.net>
Message-ID: <20010620.200356.1883673119.2450@cr810798-e.cambr1.on.wave.home.com>
Source record: 36143

Well just my 2 cents worth, about open source and the Atari =)

I do like the idea of open source and GPL, but also on the other
hand there has to be some close source projects too, this is
where I would like to see some open projects done for the
Atari 8-bit, I see some hardware hacking etc, but I would
like to see an area that has atarians in one location.

I moved over to linux some time ago, and just dug out my
Atari to do some hacking with it, I seen some neat stuff
on /. about an Atari 800 as a webserver and the Atar/UX
Project.

Also I been IRC'ing for many years and came across a very
nice IRC server that has alot of devlopment people on it for
differnet platforms (OPN) and would like to suggest we get
some Atari 8-bit junkies on it, and get some shared development
and help happening =)

Just a suggestion for #Atari @ irc.openprjects.net , don't know if there
is a place if any that you's may be now, please comment here!

Info on OPN

Open Projects Net exists to provide an interactive environment
for free software and open source projects and support groups.
Our network is currently implemented using Internet Relay Chat
(IRC). Our aim is to help improve the communication and
coordination skills of our participants and to maintain a friendly,
efficient environment for project coordination and technical support.

In 1998, OPN had about 100 users and less than 20 channels. Our
current peak is almost 3,500 users and over 1,200 channels. It's
hard to maintain a friendly IRC environment, and we put a lot of
effort into it. It requires social hacks and software hacks. We
continue to grow and we'll continue to work to make the network
a productive and useful place.

Currently, we are getting ready to set up a US 501c3 (non-profit,
tax-exempt) corporation to further the growth and management
of the network.

Doom came out after Wolf 3D and allowed rooms with walls at any angle AND allowed texturing or those walls.

>What exactly is Wolf 3D?
Wolf 3D is a 3D game (thru your characters eyes). The shortcoming of the game is that the walls are at 90 degree angles, so all the rooms are various sized boxes.

I recently acquired an Atari 800 and a Rana Systems disk drive. I followed the directions and set up the disk drive with the proper address for drive one plugged it into the periperal port. The drive spins and counts up 39 tracks but the Atari doesn't seem to recognize it. If the basic cartridge is in the slot when I typ DOS it goes to that memo pad thing. If the cartridge is not in it goes straight to memo pad. I've tried it with multiple dos and other disks and it just seems like the computer isn't recognyzing the drive. I'd really like like to get this thing to work, the previous owner is a friend and he said it worked the last time he tried it, Please help me to resurect this thing if you can. Thank you

FamilyNet Newsgate

This is in reguards to my website at...

http://www.geocities.com/lady-aramis/atarinewtonmod.html

This site is devoted to making the tunes of the Atari computers and games available on the Newton MessagePad, since, after all, the best home computer works best with the world best PDA. ;) On this site there are zipped mods already in .pkg form, as well as raw mods for downloading and converting on the fly for Newt's Cape users, and a few mods thrown in that were not neccessarily Atari in theme but cool anyway. :)

So pay it a visit! All the contributions back in September were ones donated by various users from the Atari newsgroups. The recent change was when a midi and mod archieve (of, oh, about 101 megs worth of music) recently opened back up. So I'll be sorting through those, posting some new mods up on my site every so often, ect.

So .mod fans, stop by when you get the chance!

Doctor Clu
Atari / Newton User

PS: Those that have geocities web accounts, anyone figure out how to upload a Newton file in it's unzipped .pkg form? I would love to have my Newton files up there for Newton users to just grab without the aid of a desktop.

Thanks in advance!

3677. Game idea's for use with Multidash/Maze of Agdagon interface

Newsgroup: comp.sys.atari.8bit
Date: 2001-06-21 11:06:04 UTC
From: nisse-ma@reze-1.rz.rwth-aachen.de
Message-ID: <9gskes$k78$1@nets3.rz.RWTH-Aachen.DE>
Source record: 36151

Howdy folks

Yesterday I came upon an article by Andreas Magenheimer about network games (ABBUC Magazin 63 (or maybe 64)). He had some suggestions for games that could be used with the multidash interface. (for those who do not know: Jiri Bernasek (of BW-DOS fame) came up with a higher tech version of the Agdagon interface. He also wrote 'Multidash' for it. With the Multidash-interface, you can connect up to 8 Atari 8 bit computers together. The first one loads the game from disk, and all others (which are turned on after the previous one has booted) boot at lightspeed from the first computer. All players are in the same game at the same time, but they all see the playfield from their 'perspective'.

Here are my ideas:

A car or speed boat race, where each player has his/her own car or speed boat and sees the track/see/lake from his/her car or boat.
You could even turn this into a chase, where one or two cars/boats are chased (as in Miami vice or the dukes of Hazzard or whatever).
Or you could have a 'Baywatch' game, where you try to rescue as many people as possible. Either as a team or individual.
Or you could have a squadron of fighter airplanes (one of the players could be a rescue helicopter pilot)
Or a time of fire fighters, with trucks and helicopters...

(I'm gonna cool my brain now.....)

Here is the listing for "Computer Blues" from my "BASIC 1"-manual.

By the way, is there any way to load a simple text file, like the basic
listing below, into any Atari-emulator? In spite of Atari basic's error-
spotting-feature I would prefer to write basic programs with decent
editor, like Microsoft Notepad. :-)=

```
10 TEMPO=4

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

OTHER USENET NEWSGROUPS:

Source record: 36156

Since you say the drive steps thru the tracks, it may be you have it
in diagnostic mode, ie. switches 3 and 4 are up(on).
You should set the dip switches all off for single density, D1:. I think
I always set 4 on(up), this allows double density disks, as well as
single density disks, the drive detects, I think.

Source record: 36157

(can use notepad to write 8-bit Atari BASIC).
Sure, but I would think you'd want the automatic error checking
by using an emulator and BASIC from there.
A notepad file would just need the EOLs changed from 13,10 to 155s.
This would be ASCII to ATASCII. You can find a simple ASC2ATAS.EXE
on my website. I have asc2atas, atas2asc for both the pc and a8 there.
http://www.en.com/users/russg see the Assembler Editor section for
download.

That's interesting 'cause if you were booting a bad or unbootable floppy it would say 'Boot Error' over and over. I don't know much about Rana drives except that I've seen alot of plees for help on them here. If you have another disk drive you might want to set it for #1 and the Rana for #2 and see if you can read any disks with it. I would also try booting MyDos 4.5 in the Rana and see if that works.

Howdy Atarians!

How could I grab some musics out of Atari800Win or other Emulators to
do a playback with WinAmp?

I remember a SAP music file player. What's up with that thing? Are
there any resources on web, containing music-stuff of classicans?

Hi there Vasco !!
Where can I find Mac Gyvers "Multiplayer" Version 2.1 ?? (The latest release I have is 2.0). Next, where can I find Madteam`s inertia players 4.x ?? greetings, Andreas.

P.S.: I am beginning to write my diploma in july/august, so I will not have the time to visit your party. Hope to see a lot of demos and intros released for atari (not only gfx, sfx and 256b intros).

Source record: 36161

Well,
there are at least 2 different "XF 551 utility disks" here in germany.
One is just a file, about 200 sectors long, it includes an XF sector
copier, an XF gamedos, plus a german manual plus a demo picture plus a
demo sound plus other demo things (its kind of a file demo!). The other
utility disk I know is a bootdisk, allthough it has BiboDOS 6.4XF on it,
it uses direct sector acces via note and point, so you cannot see much
in the directory nor can you access any single files from a DOS... When
you boot up this disk, you see a demo screen, press "Space" here and
wait some time, until the loading process continues. Next comes a menu
screen, where you can choose to load a sector copier, file copier, game
dos, Dup, etc. All of these items are written for XF drives only...

If you are interested I can send you a medium-density disk (double-sided
flippy-disk) which contains both of these programs plus many more XF551
utilities... -Andreas

P.S.: I also have most of the mentioned DOS versions, like Turbo-DOS,
Bibo-DOS, Super-DOS and DOS-XF...

3687. Re: Game ideas...

Newsgroup: comp.sys.atari.8bit
Date: 2001-06-21 17:07:58 UTC
From: Andreas Magenheimer <magea000@mail.uni-mainz.de>
Message-ID: <3B3229EE.31B38945@mail.uni-mainz.de>
Source record: 36160

Well,
how about: 1) Dynakillers for 4 players simultaneously ??? Using a) the Network or Multilink hardware (once called Octagon, created by the Agdagroup) or b) the multijoy hardware (from Radek sterba) to connect up to 8 joysticks to one computer/one port ?? You see, Dynakillers only uses one screen, so there would not especially be any need to have several computers connected, one would be enough;
And with 4 players and 4 joysticks (on XL/XE computers !) no-one needs to use the keyboard, since the keyboard player is always the first to lose... The screen is simply gr. 15 (or so), any player starts in one of the four corners, collecting bombs and extras and bombing the other players. the last one who survives, wins the round... the one who won the most rounds wins the game...

2) I would like to see a multiplayer car race, like Pitstop 1 (simple graphics, but cool and fast game; whereas Pitstop 2 and Pole Position have better graphics but are boring games!), this new car race should be playable via Network for at least 4 players (using the Multilink/Octagon hardware), thus every player would have his own screen. Next, talking of Pitstop 1, the simple graphics would be ok in the Network race, but of course I also want different tracks (not just one, as in PP) and the chance of a tournement or championship race. therefore one could "leave out" the need to change tires... just racing against human (and/or computer) opponents would be enough. the speed should therefore be as fast as in Pitstop 1 (and not as slow as Pitstop 2 !!). well, I am writing another german article for ABBUC mag about that. it is much easier for me to tell in german language...

3) How about some "Mr. X." or "Scotland yard" or "N.Y. chase" kind of game on an XL/XE computer ??? You know, in the board version, 3 or 4 players are hunting for Mr. X, who is invisible most of the time. The hunters (hunting on a city map of London/Scotland Yard, New York/NY chase or west-germany/Mr. X) only get to know if Mr. X uses bus, underground or taxi to move from one point to another. I am thinking of a new 4 player multilink-game, where 4 players are hunting the computer or just 3 players are hunting for another player. the map could be any map you like, New york, London, Paris, Berlin, Germany, USA, UK, etc. the game should be written for 4 players using the multilink network; It could be any graphics mode you like, i.e. gr. 8 (with dithering!) or gr. 7, gr. 15 (with colors) etc. - therefore the whole map should consist of 4 separate screens.

Well, the german version Mr. X is written in Atari Basic and was once published in Atari magazin; it uses less than 48k Ram, but has only text graphics; There is also an upgraded and commercial version of Mr. X

avaiable (also german!), this one uses 128k memory and gr. 15 maps (one color, four shades). Guess what, the PD version is much better than the commercial one, but maybe someone could do a 64k version with graphics and network-options too ...

4) How about a new Dart game ??? Well, computer darts is boring for me. Most games use a flickering hand or dart cursor. But how about a lightgun Darts game ??? One could draw a gr.8 dart board and use the ligthgun as input device. this would make the game a little more realistic I think. And you could program the game to support different dart versions (501, 301, etc.) and up to 4 (or 8) players, one after another. So you would need only one lightgun and one computer (no multilink network, no multijoy-interface). Thats all.

Ok, I am out of ideas now. Of course I know, that many british and american users do not know the multilink-network or multijoy-interface. Well, take a look at Umich or other pages to find "Maze of agdagon" and its accompanying texts. Or get the appropriate (german) ABBUC mags from Wolfgang Burger (the manuals for the multilink games are at least written in english!), which contain Agdagon and multidash. For the multijoy-interface get the czech games "Cervi" and "Multris" and take a look at:
http://www.info.cz/raster/atari/hw/multijoy.htm or just
http://www.info.cz./raster/atari for all his other Atari stuff.
Greetings, Andreas.

Gah. I'm thinking of the 2 or 3 sector loaders for normal DOS files. It's
been too long; fortunately I've just moved and will shorty have a computer
room - time to break out the 800xl!

Pay no attention to the man behind the curtain...

Hi All,

Does anyone know where I can get my hands on the schematics for the 810
Floppy drive?? It just went wheels up and I wanted to do a little
troubleshooting.

Cheers!
gL

3691. Announce: Minigame coding competition

Newsgroup: comp.sys.atari.8bit
Date: 2001-06-21 23:02:53 UTC
From: gasman@raww.org.RemoveThisBit.invalid
Message-ID: <3b3277b8.14474324@news.ukonline.co.uk>
Source record: 36165
Cross-posted to: comp.sys.sinclair,comp.sys.amstrad.8bit,comp.sys.atari.8bit,comp.sys.cbm

The Minigame 8-bit coding competition is now officially open, and the website at http://demo.raww.net/minigame/ is ready and waiting for your entries.

For those who haven't seen the discussion in comp.sys.sinclair and comp.sys.cbm - the aim is to write a game in 2K or 512 bytes of code, for the Spectrum, C64/128, Amstrad CPC or Atari 8-bit. Entries can be in machine code, BASIC or a combination of the two - see the rules page at http://demo.raww.net/minigame/rules.html for the full details. Incidentally, I'd be grateful if anyone from the Amstrad and Atari sides could provide some brief notes about recommended emulators and how to use them, similar to the Spectrum notes already on the site.

Message-ID: <tj53glg0s8r58d@corp.supernews.com>
Source record: 36167

Here's a bit out of the XFormer manual:

.
.
.
You can also specify individual MS-DOS files on the command line. They will
magically appear to the emulator as disk images containing that file.

When specifying disk images and other file names on the command line, you
can
use full path names. For example:

XFORMER C:\ATARI\DOS25.XFD D:\BASIC\RAINBOW.BAS

will load the DOS 2.5 disk image from the C:\ATARI directory and load a
BASIC
file as drive D2: from the D:\BASIC directory. This way you do not need to
keep all your Atari 8-bit software in one directory.
.
.
.

Hope this helps!

Keith Olson

P.S. How do you load BASIC programs off of a disk? A dumb question I know,
but I gave my 800XL system away almost 7 years ago and I forget.

Most of the emulators will let you specify a file which you could Copy to an image from DOS or LOAD"D1:RAINBOW.BAS" or ENTER"D2:RAINBOW.LST" to Basic and then SAVE them to an image.

TextPro can do a global replace of the ctrl-M and ctrl-J to the Return character by using Esc, ctrl-left arrow.

AtarUtil for Windows provides a translated or binary option for adding files to images; believe it is from Ken Siders.

The drive and the 800 are definitely NOT communicating; the computer doesn't even realize it is there. That is why DOS isn't booting and no 'Boot Error' message is generated.

There are some Basic commands with USR( ) calls you could try for testing some functionality; but 1st the 2 components must recognize each other...

This may be a dumb question, but are you booting it at all?

1. Turn on disk drive.
2. Insert DOS system disk.
3. Turn on Computer

It should then boot up.

If the computer and drive were communicating, your Rana would start to
spin, and the track counter would quickly count down to track 00 to boot.

It sounds like they're not communicating with each other at all.

Try the SIO cable in the other connector on the back of the drive and
see what happens.

Also, re-verify that the drive is configured as drive 1.

If the drive indeed was working before, it sounds like you have either a
cable or drive select problem.

i wonder if it could be out of speed range. i have 2 rana's and one works
well but the other only works occasionally. that one i have to adjust the
speed so it is 288 rpms. it is currentlylike 290 to 295 rpms.

it wouldn't boot either. thats why the seller on ebay sold the pair as one
working, one non-working... :-)

For what it's worth, I agree that Action is the best language to use on
the Atari. Its editor takes a little getting used to but the dual-window
ability is really nice. I must be part of the 3%. I regret not doing more
programming with it.

3705. Problems with an XF551

Newsgroup: comp.sys.atari.8bit
Date: 2001-06-22 23:51:23 UTC
From: Paul Barker <pbarker@ntlworld.com>
Message-ID: <jXQY6.6109$Cc3.874244@news2-win.server.ntlworld.com>
Source record: 36179

OK. I have an XF551 which kinda works. It will load software but with a lot of errors. I get the usual "bleep bleep" of disk files loading interspaced by the boot error noise (and some times boot error message on screen).

I swapped the drive mech into my good XF551 and it works perfectly. So I guess the problem is on the logic board. I cant see any obvious dry joints or PCB track cracks.

Any one have any ideas ? I'd love to get this drive working, but at the moment it looks like it's heading for the spares bin :-(

All help apreciated !

Paul

Hi Tom,

Sorry to take so long to reply. I've been thinking about this.
It's not quite what I had in mind for a project, but it might be
fun to do.

Would you consider releasing the source for the Linux version
under an open-source license?

I still will have to write (or find) some software that will
let me use an SIO2PC cable emulate both a floppy and a serial
port before I could start, unless a real 850 or P:R: connection
magically appears at my doorstep.

Regards,
Phil

What happened to that program? Do you still use it? I read somewhere
(probably on the CTH site) that the A800 emulator (IIRC) can now
let you connect to a BBS over the Internet and then talk to it
via the R: device.

Well, I wasn't proposing to port all the GNU tools over as-is.
I was thinking more of writing some of these apps from scratch.
Done the right way, it should be easy to write a simple text-based
web browser in BASIC, for example. A mail tool would be even simpler.

Granted. I'm not counting on anybody, just hoping. I don't care what tools anybody cares to use. As long as the source is freely available, people can learn from it and adapt it any way they want. I'd like to make it so the choice of language is wide open. That's why I'm trying to get up to speed on the software architecture of the Atari 800 DOS(s).

My personal preference is C because I think I can be more productive with that, but I can work in assembler if I have to. I don't like BASIC very much, but that's my personal bias. I hope the system is flexible enough to hide the choice of language from other applications.

Regards,
Phil

It went to electric la la land. It was available for quite a while on
Compucat BBS.

Compucat is still around, just as a www site now.

One of those things that is easy once you know how. There was a short
program that appeared in the book "Free Software for your Atari" cira
1980ish. In it there was a program called "miniterm" by Jim
Steinbrenner of Amodem fame. Once I had his command set and procedure
for serial communications I was able to translate it to both asm and
Action!. Couple of other sources like PR:Connection manual and I had the
values for baud rates up to the limit the Atari can handle.

If you like I could post the code, only about 10 lines of BASIC if I delete
the REMs.
>

No, it was a commercial hardware hack to be cheaper then an Atari 850.

Nick Kennedy independantly arrived at a similar design creating an Atari disk drive simulator using an IBM PC to simulate the drive called SIO2PC. Ken Siders independantly reverse engineered the design of the R:Verter. Stever Tucker expanded the capability and functionality with his APE program. I came up with a simple hack that people can make from commonly available parts. webmaster sells them cheap on eBay for people that don't want to solder.

So you have a fortutitous convergance. The simple and commonly available design is able to work with a 20 year old R:Verter handler to make teleneting done.

What it should mean is all the storage for Atari => huge file base is almost done. That is, you could in theory hook up a graphical based Atari terminal program to a telenet site containing hundreds of megs of playfields.

I think I actually posted messages to the newsgroup back in the late 80s for the terminal program I wrote. I don't know if people are still around that remember it. Mostly every special line had something like like a #G preceding it for everything that needed to go through the interpretor and text going to the text window just appeared normally.

Blast from the past. I am pleased with the success of games like Diablo, Ultima Online, Everquest, and AC. Took them ~8 years to catch/pass us up.

I think it still has application in the consol market anyway.

C isn't a bad choice if you can adapt to other calling conventions or have people adapt to C.

I mean as an assembly language programmer, you just tell me how you want to pass parameters to a subroiutine and that is enough. Ditto for Action!

There is resistance to learn anything other then exactly what you already know. I mean it is really as simple as people that are used to passing the high byte/low byte through the XY registers will stone wall you on switching to YX order. We are after all a bunch of prima dona's.

Still commercial/copyrights in effect. It was a brilliant translation
of a Pascal like language with C type constructs into an almost macro type
compiler. Great editor that I still use as the measure for a programming
editor.

The manual was not that good for teaching the language and the product
suffered because of it. Roughly it produced code about 70% the speed of
straight assembly language and if you knew asm writing your own subroutines
was trivial.

Several games and applications like HomePac came out written in the
language.

> language?

Um... SpartaDOS has a primitive form of MS-DOS. BAT files are prepended with a Minus character or something? There was a CLI project for MyDOS that went no where. I think they called it BBK or something? The Forth command dictionary can act as a quasi scripting language, which is one of the advantages of using Forth. You can use disk commands in Logo. Or you could whip up a command parser in CC65, although there may not be much RAM left. The traditiona method for scripting was to "chain" BASIC programs together, clearing the symbol table and erasing the BASIC program workspace between calls. You had garbage collection problems, line delete freeze-ups, and RAM leaks under some versions of BASIC....

I recently acquired a Mosaic Ram Select 64K memory board for the 400 & 800. There are detailed instructions for installation in the 400, but not a word about the 800, even though the package is labeled "400/800". Does anyone have any instructions for the 800 installation, or remember anything about them? I think that there was a review in Analog or Antic so I will search that. I also did a web search, and I don't think that Mosaic survived -- at least under that name. Any ideas would be welcome.
Thanks,
Larry White

No, it was just a simple terminal/interpreter I wrote. #G was the escape
sequence since I wanted to keep it ASCII and anything immediately following
the #G was parsed. If for example you wanted to change someones left margin
you would just send them
#GPOKE 82,0
For example, even reading this message in the newsgroup using the terminal
program it would have actually changed the left margin.

I had quite a bit in there, things like BLOAD() and USR() so you could
replace character sets and run machine language subroutines.

It's amazing what one can still do today with 16k:)

The company I work for, a 100 year old 150 million+ a year company, runs on lots of small basic programs that take probably less than 16k each. Each user (150+) telnets to a RS/6000 over a Frame Relay WAN (30+ sites) to have a BASIC intepreter (BASIS PRO/5) start in his/her .profile. I'm talking line numbers too. It's a flavor of BASIC called Business Basic.
What happens when there is a run-time ERROR? Yup - our "consultants" dial directly into the RS/6000 and start hacking BASIC code in the users session (via a pcAnywhere-like tool for unix terminals).

Who knows - maybe my TurboBasic skills will pay off here :)

IIRC, the Os/A+ Dos family provided some kind of primitive batch-scripting as
well. A batch file was simply a listing of commands for execution, no fancy
argument parsing etc.

So long,
Thomas

I wrote an article about 800XLDJ which is an Atari 8-bit peripheral
emulator (like an 1050). You have to run the program on a 16-bit or
greater Atari computert. You also need to use the SIO2ST(PC) cable
which hooke up to the modem 1 port of the Atari computer and the
peripheral port of the 8-bit. To read the article goto:

>did a web search, and I don't think that Mosaic survived -- at least under that
>name. Any ideas would be welcome.

Not much help here, but,

We had one of these installed in our 800 for years. I think the 3 slots went 16K+64K+16K, for 96K total. I remember jumper cables being involved, and that hardly any software supported it beyond 48K, as it isn't Axlon compatible.

Later I took it out and made it a normal 48K 800, because the Mosaic board caused complications running some of the games we played.

I'm not where that stuff is at this time, so that's about all I can say,

-Michael

What you called the Agdagon inteface is actually called "Gamelink II". Developed by Dataque/Agda Group. The "Octagon" in another post was an 8 player interface/buffer. I have no idea what they still do or support. But, I did design my own 6 port adapter prototype(I still use once in a while, but figured out its drawback), and after several tries, came up with a single player connector that was more useful.

And I am wondering what the "higher tech" part of the contribution is.

I have read other posts on more games/uses for the GLII system, but not read any results.

Midi Maze on the ST came first, obviously since all STs have the ports,
and no A8s have them. GLII and Maze of Agdagon was the first attempt I
know of to create something similar on the A8 using existing ports.
Worked quite well. Something that should have occurred much earlier.

MIO Clone

Im thinking on doing a small run on the MIO.
ICD sold there 8bit line to FTE (Gone a long time)
and with the low cost of doing a run there days it would be easy to do a run
.
If anyone has the rights (c) to the MIO leave me Email.
This new MIO will be alot smaller due to new chip design and would give
users a chance to get one, that's almost imposssible to find these days.

Wait a minute! Something is starting to come back to me! I remember that
there was an experimental batch system for MyDOS that used commands like "#IF".
As I was new to MyDOS at the time, I managed to clumsily erase the pseudo
batch language with an accidental format command. I never could find that
MyDOS batch extension again. I may even be imagining the whole thing?

Yeah and it looks like ol' Bruno is putting 400 people out of work. It's a sad day for the Atari name, no longer will it be known for it's cutting edge way of setting industry standards. Now it will be known for creating one hit wonders like 'unreal'. That's as long as they don't go bankrupt. Companys that are doing well don't usually lay off 20 percent of their crew. It will never be the same Atari to me, just a gimmick to sucker mainstreamist into buying expensive junk games that will do nothing but lose value over time. I'm going to play Jungle Hunt now and try not to think about it.

OK, brief explanation of Atari OS design just in case you aren't familiar with it. Actually just about every modern OS from about 1979 on has the same features. Atari version calls it CIO or Central Input Output. They wanted to keep interfacing between different devices similar such that a PUT to the Screen was virtually identical to a PUT to the Printer.

They did this with a bunch of built in routines in the OS and a Handler Address Table that are loaded into low RAM on boot. The handler table can be extended beyond the simple screen and printer routines which is how the R: handler gets loaded, it is not in the OS by default.

The advantage of this is you can do some pretty esoteric stuff. For instance, there was the MPP modem that plugged into a joystick port and had its own handler. I reverse engineered the device/handler and came up with a cable that only used a resistor and zener diode so you could use a Hayes type modem.

The terminal programs, if they are written right, don't know the difference between talking to a modem hooked up through an 850 interface or hanging off a joystick port. All the magic is in the OS and handler.

Now let's hope I can type this right.
50 CLOSE #1:CLOSE#2
60 OPEN #1,4,0,""K:"

```
65 REM SET UP FOR 300 BAUD ASCII
70 XIO 34,#2,192,0,"R:":XIO38,#2,0,0,"R:":OPEN#2,13,0,"R:":XIO
40,#2,0,0,"R:"
80 REM CONTROL LOOP
90 STATUS #2,C:IF PEEK(747) THEN GET #2,C:?CHR$(C);
100 IF PEEK(764)<255 THEN GET #1,C:PUT #2,C:GOTO 90
```

I think that is right. If you have a serial port and handler loaded on the Atari you should be able to hook it to a clone and change the consol or load a terminal program to see if it works. If you hook it to a Hayes modem, you will have to use the Hayes command set to access the modem i.e.

Howdy folks

>I'm trying to write a CD Audio Player utility for my Atari 8 bit computer and
>have run into a problem. The READ SUBCHANNEL command doesn't seem to want to
>return any data. (no subchannel data sent is what it tells me). Could this
>be the CDROM (Pioneer Slot-In 32speed) or my fault?

It was my fault. I should have typed 'for x = 0 to 15: (print to screen
command) peek(address+x):next x'. But I typed '.....(address)+x.......'

Now it work OK. I can PLAY the CD, skip to the NEXT track or the PREVious
track. I can even leave the utility (while the CD keeps playing) and when I
come back, the utility knows which track is playing at the moment. Meaning it
always jumps to the right track when pressing NEXT or PREV.

BTW I found out that you can test if and what buttons on the CD ROM player are
pressed (if it supports MultiMedia Commands). You can even prevent that the
CD ROM (or DVD) reacts to that. Hmm, that means you could REALLY play with
somebodies mind and use some code to change the funktions of the buttons....

Back when our computers where still sold in big stores, people would type in
really nice programms that used a long for-next loop (so they themselves could
get away from the computers) and then turn up all the sound channels. How
nice would it be to have a little PC Utility on a 3.5" PC disk that you could
load into a computer at one of these stores where you sell PC's (but where
they have NO clue) that would mix up these buttons. :-)))

>If anyone has the rights (c) to the MIO leave me Email.
>This new MIO will be alot smaller due to new chip design and would give
>users a chance to get one, that's almost imposssible to find these days.

If you wanna improve on it, I'ld suggest the following:
- Make it willing to share the parallel bus (maybe even a true parallel bus device
- Change it so you don't loose the programm that's loaded before you enter the menu

CU Mathy van Nisselroy

PS if you're into software writing, might I suggest you contact Matthias Belitz and write a version of his ASPI Manager for the MIO? (ASPI in short means each piece of hardware that has a harddrive interface, and is smart enough, has it's own device specific ASPI Manager. Software written for one interface would then also to run with another interface.)

3746. CD Audio software done (you need BB, SCSI Cd ROM and ASPI manager, which is software)

Newsgroup: comp.sys.atari.8bit

Source record: 36068

Howdy folks

My Cd Audio Player utility works. The user interface is crude (to say the least), but you can PLAY, NEXT, PREV and OPEN. NEXT and PREV even work if you leave the CD playing while you leave the software and go do something else (like play a game, use some other software, whatever) then come back and skip to the previous or next track. The software knows what track is being played.

I'll post the LISTed TurboBASIC listing in alt.binaries.atari. All you have to do is get the ASPI Manager software (ask me) and connect a SCSI CD ROM player to your BlackBox (sorry, Matthias Belitz didn't have time to write ASPI managers for other interfaces. And at the moment he's the only one working on this.) A yes, convert the CR/LF to EOL.

CU Mathy van Nisselroy

PS I'ld like to thank Matthias Belitz for writing the ASPI manager, associated software and especially for helping me write this utility.

Hi Mathy,

This first run I have plan is just a clone of the 256k mio, a small run of about 50-100 units. I do have plans on enhancing it the future. Im looking for the MIO Schematics at this point, if I dont find them soon I'll do the Cad from one of the MIO I have here (just remove all ic's) and have the boards made. I just did a cad on the 256 Ramcard and will send it out this week. Im also working on a 512k version for the second run. I wan't to hear from FTe or anyone that has the (c) rights to the MIO.

I have an original SWP disk and no books or instructions on how to copy it; it cannot be read in Atari mode - even on the same drive which will boot it into CP/M mode.

You provide the directions and the disk & postage, and we can work something out.

>"RoyE" rdean@fix.net asked:

>do you remember if you have any of the boot disks for CP/M emulation.

-Ron

Experience is something you don't get until just after you need it.

Back then, I once wrote some software for KMart that stopped vandals
doing things like that. It was a Kmart logo with smooth scrolling
price information for C64s on the display floor, and provided no way
to cleanly exit to BASIC.

This is an old teen-hacker topic, the last method I heard of using was
bringing your own boot disk with you to the store, reboot the demo computer
on it and it will bypass the stock autoexec and config.sys. Then of course
you edit the comps startup files and reboot again, then as they say "It's
own3d!!"

A few years ago, in the early 90's, a friend of mine wrote a game based on a fairly obscure writer's book. The game was called "Evening of Horror" and was a multiple disk adventure game. My friend wanted to sell copies of his program, and did.....he sold exactly ONE copy, so some guy on one of the BBS's in Toronto Ontario. Unfortunately, this guy, had read this obscure book the game was based on, and panned the game on the BBS. Therefore no more copies were sold.

My friend had a nasty girlfriend who at the time destroyed his master copies. Nevertheless, I had a backup copy of the game on multiple disks..... however, when I went to copy the disks, the first disk was bad! So, there is possibly only ONE copy of a game out there, that this person probably has thought it wasnt ethical to pirate. I cant remeber the guy's name who bought the program. Hopefully, he copied it,....or gave a copy to a friend, or he can be located. So, anyone who was on the BBS Express Pro network in the early 90's (USF Net) may remember talk about this game.

The game was called "An Evening of Horror".....it would be a shame if it never saw the light of day.....

Write down phone number from title screen.

When Level 1 starts, hop up on girder to avoid bottom mutant.

Type in phone number.

From now on Shift plus a digit (1, 2, 3 ..0) will take you to any level 1-10.

> Kam Bansal kam@magickhat.com asked:

I seriously doubt if that little sponge roller can absorb more than about 0.5 ml at one time ...

Also, most of the inkjets use a product based on water/glycol whereas the 1027 IIRC used an oil based ink more like traditional ribbons or maybe stamp pads.

The problem I've noticed is that the roller itself wears down into grooves
where it contacts the printhead. I believe the best solution is to find an
apropriate roller.
This might be a good letter to the new Atari company!

Something I saved from a long ways back:

Subject: UPGRADE: 600XL -> 64K Memory

HOW TO UPGRADE YOUR ATARI 600XL TO 64K RAM

THIS MOD IS COPYRIGHTED BY KEN SUMRALL. HOWEVER, YOU MAY FREELY
DISTRIBUTE IT, AND MODIFY IT, AS LONG AS THIS NOTICE IS INCLUDED
IN ITS ENTIRERTY. THE AUTHOR MAY BE REACHED AT THE FOLLOWING
EMAIL ADDRESSES:
ken%hpda@hplabs.hp.com
...!hplabs!hpda!ken

You will need the follow parts to perform this mod:
(2) 4464 RAM chip, 64Kx4, 150ns or faster.
Additionally, you will need chip pullers, a soldering iron, and 3 small
pieces of wire. I used wire wrap wire when I did this mod.

If the chips on your 600XL are socketed, you're in luck, otherwise, you
need to
first unsolder the following chips:
(1) 74S32 location U18
(2) 74LS158 locations U5 and U6
(2) 4416 locations U11 and U12
and put sockets on the mother board in their place to make the job easier.

Now bend up pin 9 on the 74S32, and put it back in its socket on
the mother board. Bend up pin 3 on the 74LS158 in location U5, and put it
back in its socket. Also, bend up pin 10 on the 74LS158 in location U6,
and put that chip back into its socket. The last two chips you need to
change are the two RAM chips. Put the 4464 chips into the sockets at

locations U11 and U12 on the motherboard.

Now you need to install 3 wires to complete the mod. The first wire should be connected between pin 3 of the 74LS158 at location U5, and pin 20 of the parallel bus on the 600XL. The second wire should be connected between
pin 10 of the 74LS158 at location U6, and pin 18 of the parallel bus. The third wire connects between pin 9 of the 74S32 at location U18, and pin 45 on the parallel bus. That's all there is to it.

Would anyone be interested in an ATR disk image with BASIC A+? It's the disk-based version of what turned into BASIC XL/XE, and runs easily on emulators. Maybe it's been out there all along, but I couldn't find it anywhere. Here's a link to my page to download it:
http://home.swbell.net/hartley4/atari.htm

No way that I know of, barring MAYBE a READS 2600 system, but even
those I don't think read carts, but let you write games to a RAM
cart I think.

Source record: 36095

Hi gang,

I'm new to the group (have been lurking for a week or so).

I've just recently acquired a 600XL (looks to be almost brand new), along with 1064 memory expansion and 1010 tape drive. My experience in old computers lies primarily with TI's line of computers (99/4A) and the Commodore 64/128 (I have a 128).

I have a few questions:

1) With the 1064 installed, PRINT FRE(0) returns 37902. Is this what I should expect?
2) After having been frustrated by the scrambling of listings with the built in BASIC, I bought a Rev. C BASIC cartridge. Does Rev. C BASIC still suffer from some weirdness? I've noticed that LISTing a program to the screen that fills the screen and then starts scrolling can in many cases cause the computer to crash.
The Rev. B BASIC would scramble listings when doing almost any editing at all and it was all I could do to load a program without it crashing.
3) It seems that using the cursor keys to edit lines on the screen (in both Rev B and C) can cause characters to appear or change that weren't there before... Does this happen to others?

Do I just have a funky 600XL or is this just the way things are?

Thanks for any information!

Casey Vanlandingham

Casey,
In BASIC all you will see is Bank 0 Main memory and only the BASIC
work area. The XL/XE series uses memory bank switching in 16K blocks.
There are programs that allow you to create a RAMDISK in the extra
memory. Unfortunately you can't use it all as flat memory. However, BXE
allows you to move your program to an upper bank and use main memory
(16) of it) for variables and the other 16K for bank switching. It is
seamless when running BXE programs.
Try BASIC XL or BASIC XE from OSS or TurboBASIC XL. These versions

of BASIC are much more stable and full featured than B flat AtariBASIC.

HA! I just figured out how to copy a BASIC program into an Atari emulator. Here's how:

1. Start up Atari800 (the *DOS* version).
2. Create or open up a BASIC program in Notepad.
3. Copy the program to the clipboard.
4. Switch to Atari800 and press <ALT-ENTER> (You'll get a warning message - Click (OK) and ignore it.)
5. Click on the clipboard icon (This stuffs the keyboard buffer with the contents of the clipboard.)
6. Click on the box with arrows/press <ALT-ENTER> (To go back to full screen.)
7. Watch Casper <G> type in your program for you. (Watch the line numbers *carefully* - sometimes the first digit is dropped. Line 370 overwriting line 70 is generally *not* a good thing. If this happens, just press <ESC> before the line finishes typing, press <HOME> to clear the screen, and repeat from step 3, selecting from the bad line on.)

NOTE Xformer does something strange to keyboard buffer stuffing - try it yourself and see. <GBEG>

Was this a joke or something? There's definitely many problems with
Atari character different to EOF/CRLF conversion. If this is what you
need, I could think of many ways how to convert $9B to $0D$0a and vice
versa. Then you load it thru H1: device into emulator by using ENTER
"H1:yourprg.LST"

Yes. The remaining memory is used by the Os, the BASIC ROM and the Os variables.

> 2) After having been frustrated by the scrambling of listings with the built
> in BASIC, I bought a Rev. C BASIC cartridge. Does Rev. C BASIC still suffer
> from some weirdness?

Nothing serious.

> I've noticed that LISTing a program to the screen that
> fills the screen and then starts scrolling can in many cases cause the
> computer to crash.

I've never seen this. I would guess that something's wrong with the memory
expansion that makes it crash due to faulty reads/writes from/to the memory.

> The Rev. B BASIC would scramble listings when doing almost any editing at
> all and it was all I could do to load a program without it crashing.

> 3) It seems that using the cursor keys to edit lines on the screen (in both

> before... Does this happen to others?

No. As the computer re-draws the character you're moving the cursor over, this
is a clear indicator that something's definitely wrong with the memory.

> Do I just have a funky 600XL or is this just the way things are?

It's not how what is supposed to happen, really. Atari Basic isn't glorious,
but it's not as broken as this.

So long,
Thomas

No, he is using the clipboard. When you paste data from the clipboard to a program that does not have specific clipboard handlers, Windows 'types' the text data through the keyboard buffer. This method is virtually the same as typing it yourself. The atari emulator will receive a 'enter key pressed' message and will tell the virtual Atari 'return key pressed', and our Ataris will insert a $9b.
The main problem that will occur is if the emulation cannot keep up with the typing rate of Windows. If you create a .pif file for your emulator, edit the .pif, choose the misc tab, and uncheck the 'fast pasting' option. This will slow windows typing a bit, and my help dropping data.

that really is a nice little 400.. i like the upgrades you have done to it
espcially the upgraded external keyboard.

i just bought 2 atari 400s that were both upgraded with 48k and the upgraded
keyboards (i like to have backups of my hardware) to relive my old days of
using a 400 when i was 12 years old. :-)

the only thing i really would like to do to them is to add the composite
outputs to them. does anyone have any ideas or links to how to modify a 400
to give composite output?

thanks
bo

Yep,
the Demo version -as is- does not work very good. You can only see the start screen. Even on emulators and on real ataris, the demo then crashes (no matter if you press start or another key). the rotating starship is very flickery and not very fast animated (I cannot do it any better - I cannot program! Still I do not say that every program is good, simply because I cannot do it better; I always tell my opinion, subjective, but my opinion!) maybe someone should do it all in Assembler. hey Polish coders, where are you ?? -Andreas.

Well,
there is of course the MyDOS Batchfile Enhancement written by german
author Thorsten Karwoth. Includes echo on/off, wait, if, then, else,
basic on/off, and many many more statements. Works good with MyDOS 4.50
and 4.53 - but needs at least 4 file buffers. the manual is written in
german, much too long to translate it - but you would get the
commands/statements at least... -Andreas

P.S.: Mail me, if you are interested... (Besides, the MyDOS 4.53 *.AR?
is a nice autoload enhancement, still the :Ramdisk option which copies
all files stored in the subdir ramdisk to the Ramdisk, is avaiable!!)
What I need now is a MyDOS Undelete and Diskfix program - from
single/90k up to 16MB partitions... Or how about a MyDOS program that
renames subdirs, moves subdirs, etc. ??

Yes and no...
well, we could use more than 8 computers, but it would be complicated
for the master to control all his slaves, next the computers are
connected in a row, using more than 8 computers will give problems in
sending/getting the data.
(I guess, the longer the SIO cables or the SIO way is, the smaller the
data stream will get... maybe wrong, just a thought!)... -Andreas

Guess who didn't read the release notes ;-)

The demo is JUST that, if you hit START it cycles thru a series of Elite
screens from within the game. It's not meant to play and says so in the
docs :-)

I suspect funky memory somewhere is the cause of extra weirdness; neither B nor
C nor even A should be quite that starnge.

-Ron

Experience is something you don't get until just after you need it.

Yeah, but "simpler" is not the same as "similar". I don't believe
the architectures are similar enough to make that work. 5200 to XL
maybe...

> could an 2600 emulator or at least some portation easly be done with a
> "nice tool" ? :-)

Big maybe. I'm not sure the XL is powerful enough, but if the
architectures WERE similar in some ways, perhaps it could be pulled
off. But I don't know.

> hey... thinking of river raid II :-)

Not sure how you mean this... There IS a River Raid II cart for
the 2600 you know.

> *heck* what lousy graphics-shit they done with a 2600....

Only looking back. At the time it was pretty f'n cool, especially
after third parties like Activision and Imagic forced Atari to really
try.

I've been able to reproduce this with both the 1064 plugged in and removed.
If I get the notion, I'll hook it up to my PC here and record a video (I
have a TV card) of it in action and see if you all can see it.

As soon as I get it up on the web, I'll let you know.

I appreciate the info so far!

Casey

3791. Re: 600XL Questions

Newsgroup: comp.sys.atari.8bit

Message-ID: <20010628205944.05021.00001552@ng-ci1.news.cs.com>
Source record: 36015

>I have a few questions:
>1) With the 1064 installed, PRINT FRE(0) returns 37902. Is this what I should
expect?<

Yes. With no Dos loaded. Unlike the C= drives, Atari loads dos from the disk.
When booting a Dos disk, several K will be lost from Basic. How much depends
on the Dos. There are many to choose from.

>2) After having been frustrated by the scrambling of listings with the built
>in BASIC, I bought a Rev. C BASIC cartridge. Does Rev. C BASIC still suffer
>from some weirdness? I've noticed that LISTing a program to the screen that
>fills the screen and then starts scrolling can in many cases cause the
computer to crash.<

Something is quite wrong. Rev C does not have that characteristic. Sounds
like a hardware problem of some type. Or (less likely) something in your
program is overwriting some Basic or O/S memory loacations, probably in Page 0.

>The Rev. B BASIC would scramble listings when doing almost any editing at all
and it was all I could do to load a program without it crashing.<
Rev B stands for BAD. The advice to get Turbo Basic XL is very good, but it
is disk-based, so you will need a drive.
Try this link and search for "Turbo".
http://www.newbreedsoftware.com/xlsearch/

>3) It seems that using the cursor keys to edit lines on the screen (in both
Rev B and C) can cause characters to appear or change that weren't there
before... Does this happen to others?<
Again, symptoms of a hardware problem, I would think.

>Do I just have a funky 600XL or is this just the way things are?
I have a dozen or so Atari's. I've never seen this with Basic A, B, or C in
any machine I own. I've never owned a 600 XL, but the first thing that I
would suspect would be something relating to the addition of the memory
upgrade.

>
> -Bob

I actually made a 15-20 second clip of that song in 1983, using an 8 bit analog to digital converter circuit I built, and hooked up to the joystick ports. I think Jeff, a friend of mine, had sent me a sample of something else and asked how it could be possibly have been done, and I happened to have the converter chip on hand and threw it together in about 2 hours. It finally used 4 bit res and some RLE for compression, all done with the assembler/editor cart. I finished the recording with my voice saying "I don't know how they did it, Jeff".

Those were the days!

Source record: 36018

Can a rev c basic chip be installed directly onto the 600xl's socket?

Anyone done this yet?

Can a 1064 be used in addition to an internal memory upgrade to 64k?
I know that for the upgrade you need to solder a jumper to the parallel
interface, I'm wondering if this will cause a conflict.

From: "V. Longo" <vlongo@home.com>
Message-ID: <3B3C4CE1.316E0967@home.com>
Source record: 36020

Hi!

I've just started playing around with Aari800Win, and I understand the concept of ATR files, and have gotten the Atari 8-bit Disk Imaging Utility ver 1.13, but I can't seem to be able to get Atari800Win to be able to load BASIC files (from the Antic resource site) with LOAD"D:blabla.bla" type commands.

The site posts the tokenized versions of the basic programs, not the ASCII listings, so I can't just do it in an editor...

Thanks,

Vincent

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

3799. Twin Galaxies Video Game Festival

Newsgroup: comp.sys.atari.8bit
Date: 2001-06-29 14:38:52 UTC
From: Stephen Knox <gooch@erols.comX>
Message-ID: <3B3C92FC.BCF919CB@erols.comX>
Source record: 36025

Twin Galaxies Video Game Festival

Twin Galaxies will be hosting its first-ever Twin Galaxies' Video Game Festival in the Sam Goody Center at the Mall of America in Minneapolis, July 20-22, 2001. One of the features of the event is a "Classic Video Game Arcade."

Classic game collectors are welcome to bring games that they wish to sell and set them up for the public to play during the weekend. There is

no charge for this privilege. The only requirement is that the games on display must be manufactured in 1986 or earlier and that they must be set on free play for public enjoyment. Each game exhibitor may hand out literature and accept offers for their games. Each exhibitor must bring at least 50-feet of their own extension cord. The games that are displayed may not be moved out until the event is concluded Sunday afternoon, July 22.

Since over 100,000 visitors per day walk through the mall, this could be

a good opportunity for game dealers to establish new contacts with people wishing to start game collections. There will be room for only 30

games, so Twin Galaxies will take reservations on a first-come, first-served basis. Interested collectors should email their list of games to walter@twingalaxies.com as soon as possible.

For more information on Twin Galaxies, please go to http://www.twingalaxies.com

Hello there kierran/paul hows the atari going, keep the faith & keep atari hummy

Anyhow's, Re: RAM's Dimms and suchlike

I allway's though that RAM was an Animal you usually saw on farms and zoo's, forget it i'm being sarcy!!!

I thought that DIMMs went out with the sinclair c5 and the speccy, nowadays it's sdram and ddr ram (for 266 mhz mainboards like asus)

Getting back to thang's atari wise, didn't atari invent the concept of the plug in memory module (aka dimms,simms, ddr ram, sdram) remember the 800 and the 400, and also the cartridges that you got with the 2600, isn't that plug in memory

Also I remember a news article in Database Publications "Atari User" Mag (earlier editions) or was it an artcile in the mailbag section stating that firebird (ex bt software) was supposed to be working on an Atari version of Elite, but Acorn or someone high up, scrapped the a8 version, apparently, according to the article, it was just too good (the a8 version that is)

When Mark pulls the preverbial finger out, lets see some screen shots of the full version of elite, on the internet

Yours Atarily

carmel A>>>>>>>

Hello mathy/andreas, how are things in mainland europe, no more bse or foot in mouth please.. Wer'e british, anyhow how is the atari thang going, keep the faith, and keep atari hummy

Anyhow's Re: Multicart devices for the best 8bit machine

I cant remember were i saw it, but I remeber an article either in dgs's newsdisk, twaugs newsletter or good ol' p6 (page 6- not the hottest part of the sun) But I definately remember an article about multicart devices for the a8, which was based on the 2600's Romscanner devices sold many moons ago (roms scanner , if memory serves me is the technical name for multicart devices

The A8* version could be daisy chained (similar to sio protocol) so that you could have multiple romscanner devices linked together, I think there were 2 versions eith 8 or 10 slot or 20 slot versions, don't quote me on it though

Re: multigames on one cartridge

Easily possible, Atari I believe already did it on one of their xe game's promotion carts, I thinks it had 3 or 4 games one of which was definately star raiders 2 or one on one (ea title), anyhow this system already exists on snes, md, sega ms gg and 8bit nes, though ellicit copying like the fabled 32, 16, or 120 in one games, I actually bought one of these cart's for my brothers gb colour, so I believe the technology is easly transferable on to the a8 system, regardless of bank switching or no bank switching (a technology lest we forget that ATARI invented, if you've ever read the story of the 2600 version of Asteroids)

When someone perfects the atari version of the multigame cart, let me know as I have over 450 (some packed) games on binary (dos format) files that I would like to see on cart, as I have loads incl.. zybex, rockford, kdsm, red max on binary (and they work flawlessy.. that I CREATED MYSELF

Yours Atarily...

The emulator I use is Atari800win.exe from this link-

http://www.cris.com/~Twist/atari800win/

You set it up so that your windoz desktop is emulated as a hard drive. Fix up a blank ATR (I usually copy and paste DOS2.5.ATR and then rename the copy "blank.atr") Load the "blank" in the emu. floppy #1 and format it. Then you just copy the file from "H1:" to "D1:"

Hope this helps, Mo

I'm currently in love with APE for dos, I think ver. 1.17? It comes with the prosystem as well for use with a 1050-2-PC cable. It allows total backup of any copyprotected floppy and you can write out ATR's to real floppys using the SIO2PC cable.

I would not say that is too low, I bought 3 of them 6 months ago for
$20.00 so if anything it is a bit high.

I don't know what the "going" price is, but although I recently sold a few Rtime 8's with dead batteries for 20 dollars each, I wont let go of my Sparta X for $25.......it really depends I guess how much use it gets. If it is just sitting in the drawer, I wouldnt be unhappy at that price. However when I use my 8 bit, I use my Sparta X. I would miss mine if I didnt have it.

DIMMs are the packages that the memory comes in. DDR ram still comes on a
DIMM (Dual Inline Memory Module). It just has its notches in a different
place to SDRAM DIMMs so you can't plug the wrong type into the wrong slots.

> Getting back to thang's atari wise, didn't atari invent the concept of

> 2600, isn't that plug in memory
Not in the same sense as ram. And back in the days of the Atari, upgrading
memory was as easy as plugging in a Megadrive (Genesis) cartridge -
therefore easier than today.

> Also I remember a news article in Database Publications "Atari User"

> (the a8 version that is)
Unlikely. The reason was probably costs against sales. Doing C64,
Spectrum, and Amstrad CPC versions were justifiable (C64 was a pretty basic
port over - bar the graphics. The Spectrum had a massive customer base.
And the Amstrad version would be a basic port over of the Spectrum.

Hi!

Can you recommend a program for creating ATR files, and inserting .BAS tokenized files? It seems that the Atari 8-bit Disk Imaging Utility ver1.13 does not do it correctly for these file types (unless of course, the files on the Antic site are corrupted)...

Atari DOS 2.5 sees the files, but when I attempt to load them, the Atari800Win emulator loads them, then just hangs if you RUN or LIST the program. (I am using the current version).

Thanks,

Vincent

> interface you need.

Hi Tom,

Ok, I figured out what was wrong with my DOS PC (bad drive) last weekend, and hope to get it set up with SIO2PC Sat afternoon (after JagFest!).

I also thought about it a little more and realized I can do all the development without the SIO2PC, after all (silly me - Linux has pseudo terminals).

Plus, I just got my Agenda PDA, which has an RS232 port and someone has already ported the Atari 800 emu to it! So now I effectively have a handheld A800 with R: drive!

So, where do we go from here?

I'm not sure people in the newsgroups want us to clutter it with programming threads or not?

If you want to email me the Win32 code, just replace ".n@t.sp.am." with "@" in the From: address above (I hope that is obvious to everybody but the spambots).

Oops, I just noticed that I forgot to mangle the From: address in my last post. Guess you can use that as-is. :-)

Regards,
Phil

I have two tiny MS-DOS programs that convert between ASCII and ATASCII that
I can email to you if you want. Once you have the program in ASCII form,
check out the thread "I want dem Atari blues". I give instructions on how
to have Windoze type in a program for you. The process requires a bit of
care, but it works well.

I tried a half a dozen ways, but nothing seems to help - Windoze just stuffs the keyboard buffer too fast. Maybe if we all whined enough, the guys who come up with these emulators would include easy access to the Windoze clipboard. After all, if DOS Navigator (http://www.ritlabs.com/dn) can read from/write to the clipboard, then so can any other DOS program.

BTW, if you have never heard of DN, just think of Norton Commander.....on steroids. For example, here is my entry under [Options/Extension File Edit] for Atari files:

```
atr,xfd {cd e:\emulator\atari8
atari800.exe -video 3 !\!.!
cd roms}

atr,xfd (cd e:\emulator\atari8
xformer.exe -J -S !\!.!
cd roms)
```

If I hit <ENTER> on any .ATR or .XFD file, it loads under Atari800. If I hit <SHIFT-ENTER>, it loads under XFormer. Sweet, eh?

Okay, you might want to try different OS ROMS under your hardware menu. I believe there is an 800OSa 800 OSb and 800xl as well as 130xe. There might be different rev.'s of the basic rom as well. Thats what I like about this emulator is that it's so configurable. I would try the old LOAD "D1:FILE.BAS" and then SAVE "D2:FILE.BAS" without doing a list. Just keep trying until you hit on something. I haven't heard of any "import" progs for ATR's other than APE.

I have a Mint dreamcast that I've used maybe 12 times since I bought it new 6 months ago. Original box & docs. included. 5 games: sega rally racing, flag to flag racing, blue stinger, NFL2K and Crazy Taxi. Also includes a 200 block memory card. If anybody has a nice Jaguar setup that they would like to trade please let me know what you have. Im looking for a good tradeup like a Jag with the CD player and games or something like that, Let me know what you have. Please e-mail me the info. at: pilot77@spininternet.com

Thank you!

Do you have a source for the parts? Some of them are pretty hard to get....

The MIO really needs a better memory setup. The new static chips would work very nicely, actually. I would be willing to do the design if you would do the building.

You cannot do that. Both the internal 64 KB RAM expansion and the
external Atari 1064 add on are +48 KB (in addition to the original
16 KB RAM configuration). A fully expanded computer can handle
a 64 KB address range. Adding 48 KB of RAM twice the way you
describe it would result in a computer that has two different sets of
memory chips for the same address range in the address range
from (decimal) 16384 to 65535.

3817. Inexpensive VGA Convertors

Newsgroup: comp.sys.atari.8bit
Date: 2001-07-01 03:01:58 UTC
From: llpwhite@cs.com
Message-ID: <20010630230158.03621.00002466@ng-cf1.news.cs.com>
Source record: 36040

Since the JAM!! came upon the scene, there have been a number of posts and questions about these devices. Today I was at an Electronics Botique. They are still trying to blow out DreamCasts, and I found two inexpensive VGA Convertors for the DC. One was called the "Blaze" and the other was called the "DC Box". I didn't buy one since I'm well stocked with JAM!!s, but these were $20 and $15 respectively, so the price was right. I couldn't open a package, so I asked a clerk (FWIW) and he told me that the standard DC outputs are composite video and stereo sound.
If you have been looking for one of these convertors cheap, and an EB is close, you might check into these. Since I don't have one, I can't say conclusively that it will work with an A8, but if the clerk is correct about the composite video, then they should work with the Atari composite out. I did not see an S-video input on either one, and I could see that there was a non-standard connector on one, so it might require surgery for input from the A8. (Buyer beware.)
Larry

Chip is M3002. Company is Marin Microelectronic (daughter of Swiss
company Swatch). They have web, but M3002 is obsolete and not mentioned
there (as it has y2k bug it's rather unusable now).

Message-ID: <siF%6.63546$HJ1.642654@e3500-atl1.usenetserver.com>
Source record: 36044

Hi folks,
In the past I had used Ape98 with windows 98 with a SIO2PC setup. I have several hundred ATR images that I would like to load onto my Atari 800XL from the PC.

Now I have a different machine with Windows 2000.

Does anyone know of a software application that will perform a similar task but that will work on Windows 2000?

If so, where can I download it and how much does it cost?

Regards,
Omar

That is a pretty good price. I will check it out next time I am at the
Mall. I paid about $80 for the one I am using now.

From: Andre <Chrodegang@t-online.de>
Message-ID: <3B3F42A6.B2A074BE@t-online.de>
Source record: 35947

Hi Folks!

After looking on some of the newer games made in Poland and other eastern european countries I'm wondering if a conversion of one of my all-time favourites 'Last Ninja' on the Atari 8-Bit would be possible. I think technically this should be no problem (still impressed from the Barbarian sprites :o), all data (graphics, music) could be converted from C64 or CPC - but are there still some coders alive who would do this (for money maybe)? Should one be afraid of Copyright-problems?

Andre

I have had excellent success with Ken's A8 WinUtil 1.13 *and* the Antic archive files. I do a lot of importing and exporting from .ATR's in both binary and translate mode.

Is there any possibility that the .BAS file was altered during a transfer? How many different files seem affected? Can you mention a specific one? Could you attach a .ZIP to mail with a .BAS file and the .ATR after it was imported for me to look at?

>"V. Longo" vlongo@home.com asked:

>Can you recommend a program for creating ATR files, and inserting .BAS

Have you tried SIO2PC in a DOS window?

Do you have access to a DOS version which can read whatever FAT that C: is using? If so, make a boot floppy and use SIO2PC from the DOS prompt.

Message-ID: <uGL%6.546$w24.795653@typhoon.columbus.rr.com>
Source record: 35906
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

The time has come for me to admit that I'm not going to be able to make use of my Atari stuff anymore. I ran out of space to have it setup a long time ago and I am now running out of storage space.

I have a *lot* of ST and 8-bit hardware, software, and accessories. I've still sufficient fond memories of Atari to want to find a good home for it all and I'm looking for suggestions! I don't really have the patience or energy to sell it all on eBay. If I can't figure something else out, I intend to donate to a local charity (they'll put it in their perpetual garage sale to raise whatever they can). I'd prefer to know that it was going to be used than perhaps pitched in the dumpster if it doesn't sell.

Any ideas about good homes?

Rob

Use APE for DOS. You'll have to make a DOS boot floppy and boot up in pure
MSDOS.

IS there a DOS window in Windows 2000?

I thought it was based on NT4 and didn't have one. I know that XP will not have a DOS window. Before XP comes out, I'm planning to redo my hard drive with a small DOS partition in addition to the two Windows partitions and Linux partition I already have.

Take care.

Alan

Source record: 35957

Hi guys,

Yes, the simplest GameLink II was described using paperclips - which people seemed to like for the simplicity. I had produced a circuit that used a single active device (74LS21) that fanned out the signals so 8 Ataris could be linked.

I don't believe 8 was the maximum, but that's all we allowed for in "Maze of Agdagon." The raw outputs without buffering could not drive more than two Ataris reliably, but with a device like the LS21 more than 8 might be possible. MOA gameplay was slow enough as it was, allowing for up to 8 players.

The details of how to program for the GameLink II interface were released by me as Action! source code years ago...

Thanks for the info - Any idea where I could find a data sheet for this chip? If I can figure out the data format of this device, I can use a newer RTC chip with a Pic processor to translate the output. Then I can use the original RTime-8 handler.

Thanks again
Kevin

This will not work as a Composite to VGA converter do not waste your time or money the converter is not a converter at all but a Box to output VGA from the dreamcast the dreamcast has VGA output i.e. RGB out repeat this is not a composite to RGB converter

While you are trying to fix your R-Time-8 cartridge, if you have an 850 serial interface, you could use a U.S. Robotics modem with a clock function as an external realtime clock, and set the ATARI RTCLOK each day. Does RTCLOK halt when there is disk access? (ATARI RTCLOK can store three days of Jiffies before rolling over.) Hmm... does anyone use modem clock functions, or was that just a wasted idea? (I've never seen any functions or drivers for them, or built-in functions in terminal programs. Was a modem clock a silly idea?)

I don't have it, but from what I understand there is no DOS access under
win2000. It doesn't handle the comm ports the same way win98/95 did either.
You'll have to use a dos boot floppy, like the win95 emergency boot disk.
Goto www.bootdisk.com and you might find help there.

I'm trying to find Hellfire warrior (epyx) on tape so I can use it with my Danger in Drindisti tape. Anyone have one for sale or a .CAS file I can download? Also trying to find "The Keys of Acheron" disk,tape,atr, or cas. Both of these are from the dunjonquest series.

Thanks Mo

Howdy david

>"I don't know how they did it, Jeff".

Didn't know you were still around.

Can I ask you something about the Infra-Red Gateway?
I'm having some trouble with it. Each time I use a remote control, the signal the Atari receives is slightly different. The .COM file does not recognise the signal and the .BAS file only shows the signal as stripes. The problem is that these stripes look the same (if I keep pressing the same button over and over), but if I enter a line into the program to show me the signal as a string of bytes, the signal differs a small amount every time.

Did you have the same problem? How did you solve it? A mathematician is trying to help me, but have you ever tried to write a utility on the Atari that will multiply a matrix with the transposition of the same matrix (still easy) and then tried to find the inverse of that????? If only TurboBASIC could could bits.....

CU Mathy van Nisselroy

PS I want to make my CD ROM player (connected to my Atari 8 bit) respond to the remote.

That sounds great. Try emailing Erhard Puetz, he might have the data sheets as he tried to smoothtalk the company into making some of those chips. You can contact him via his home page at http://www.atari-central.de/floppyservice/floppy/gb/index.htm

BTW why not try and use one of those atom-clock things to get the time and turn that into RTime8 look a like code?

Howdy folks

Last Friday I ran into a CD ROM that has video on it. (BTW, nope, no nude ladies on this CD) It required Video for windows, Quikview or MPEG plus a minimum of a 2 or 4 speed (I'm not sure) CD ROM player and some PC. When I went back to get the CD a day later, the shop was closed untill further notice.

Has anybody ever tried to use one of these Video CD ROM's on an 8 bit computer? Did you succeed? Were you able to have the video run at it's intended speed? How much did graphics suffer?

I doubt that, but can't prove that (don't have R-Time8 to test).

But: there's only 8bits of year info - i.e. years 00-99. If it's just stupid 1900 + value, then after 31.12.1999 it wraps to 1.1.1900. There is problem with day of week and 29.2. Maybe they use windowing, I don't know (00-value = 2000 + value, value-99 = 1900 + value).

Good gosh, Mathy, you can't run a VCD on an 8bit computer. That
requires a much more powerful processor and more memory. I am not in
the habit of saying "never" but if a programmer managed to play a VCD
on an 8bit I would regard him not only as genius, but as the new
messiah.

There are video sequences on the breadbin (mainly in demos) but they're
not realtime decoding the VCD format and that's where the processing
power comes in.

Hmmm. At least, with 1 mhz or somewhat it is impossible to decode it
realtime. On 8 bitties, there is also often color restrictions which
makes more problems. Many machines have only 16 colors and restrictions
with those.

On a c64/128 there is one possibility: SuperCPU that runs at 20 mhz. I
think it might be able to do the decoding, especially if it has 16 megs
of ram memory. First it would decode its memory full of images. Because
of the c64/128's heart still runs at 1 mhz and this makes slowdowns if
the supercpu is programmed wrong, the pages would be copied to the
videoram using buffer technology. So, when the vicII draws the first
picture, the second is copied to another page and page is flipped.
Again, the vic draws the following pic, the next pic is copied to the
unvisible memory area. At same time, the program could fool the video
chip to use more colors than originally intended and decode new pictures
to the memory. And, the picture copying can be possibly done with
interrupts (yeah, 16 khz interrupts on 64... wow) so that the program
flow wont slow down much. The sound could be played out using the sid
sample register or a recistor net connected to user port or own made
hardware in somewhere (it can also be driven by the interrupt handler)

Let's face the reality:
when a video cd is played it means somewhat 150-200 kilobytes per second
transfer speed. Then it must decompress the mpeg stream and grunch it
somewhat that the huge amount of colors get to fewer colors.

A general Philips Video CD needs a speedy 486-66 or faster to play
correctly. But x86 chips are somewhat crap. So I think it _is_ possible
to use the 20 mhz 65816 upgrade to decode a vcd.

Hmmm. I could have sworn I read something about R: support being
added to A800, but now I can't find it.

Could it have been another emulator?
Perhaps it was your cth emu, which I understand was derived from A800?
Does anybody else know?

I might take a look at the A800 source and see how hard it would
be to add (just what I need: yet another project!).

In any case, if your PC-Gateway works with dumb terminals, it should
be fairly easy to test a *nix port with pseudo terminals.

Interestingly, while searching for the emu R: support reference,
I came across a thread on this newsgroup from a couple years ago
talking about using a sockets proxy on a PC to connect an Atari 800
to the internet. I'm wondering what happened to that software
project? I think it was something Greg Menke was working on.

Regards,
Phil

: > It's not the chip that has the y2k bug, it's the software.

: I doubt that, but can't prove that (don't have R-Time8 to test).

It looks to me it's just in the software, since the latest Sparta-Dos
package provided an updated TDLINE.COM to get the right time/date on top of
the screen, and you could use it instantly (no need to wait till 2000
showed up).

The RT-8 just outputs numbers, and the software (SpartaDos itself or
TDLINE) decides what to do with it.

Depends on how your display it set up. If using "PRINT" statements, it
won't be easy, but when writing directly to the screen-memory, it's really
easy (DPOKE/DPEEK address #88 (#89). This way you'll loose compatiblity
with customized E: handlers (Flash80, XEP80, whatever).

Hello.

I did this kind of thing for the SuperCPU. I created a program called
'Silicon Dreams' and was originally distributed via Loadstar. It could
create and display video streams. Audio wasn't added.

Basically, I used a utility called 'Fast Movie Processor' which cut up the
AVI or MPEG into individual BMP's. Then I used ConGo to convert these
individual BMP's into 4bit files. Silicon Dreams then pieced together
these individual 4bit files into a compressed videostream. This compressed
videostream is further compressed using pkzip2.04g.

Silicon Dreams then can playback this compressed file. First, it
decompresses the pkzip2.04g datastream into SuperRAM. Next, during
real-time, it decompresses an individual FLI frame onto the screen. This
is with the VIC-II chip into the FLI resolution. I was able to achieve an
average frame rate of roughly 6-8 frames a second.

Enjoy.

Greg might have been working on something like that. But I did the PC-
Gateway which does the PC proxy thing. I also made the changes to the
emulator to run the R: device over the winsock.

Which no other device than a RamLink can achieve on the C64 (with a
SuperCPU).

PT> Then it must decompress the mpeg stream and grunch it somewhat
PT> that the huge amount of colors get to fewer colors.

If you want process 30 frames per second of 352x240 pixels on a 20 MHz
CPU you get: (20000000/30)/(352*240) =~ 8 cycles per pixel. That's not
even enough time to LDA/STA the bytes from SuperRAM to graphics
memory.

PT> A general Philips Video CD needs a speedy 486-66 or faster to play

Thanks again. I sent an email to Erhard Puetz, hope he has the data.
What are the atom-clock things you mentioned? I was planning on using an
Epson RTC chip I have, but could use almost any chip since the Pic will
translate for the R-Time8 handler.

Paul,

I don't have the link handy. But Bob Woolley published a modification for the 1200XL to add a parallel bus to the computer and a IDE controller. A small laptop hard drive would be ideal for the IDE modification.

Try searching at www.google.com. Great search engine. Try searching for "Bob Woolley". Maybe "1200XL IDE Modificaiton."

BY: Atari 8 Man to All on Mon Jul 02 2001 22:55:21

Besides Ultima, wasn't there an RPG game for the ATARI 6502 8-bits called,
"Alternate Reality" ? Folks used to talk about it in message after message
(also a sequel, called, "Alternate Reality: The City").

Legend has it that the game had some type of ingenious Vertical Blank Interrupt
copy protection that no one was ever able to break without personal instruction
from the author, himself. Was this a 2D game? I'm curious....

Hi Atari Bob,

The Mio Clone is still in the planning stage, I have located all parts on the internet (4 diffrent vendors). I want to change the ram, due to hard to find sipps. Your input is wellcomed!! As I want to make a smaller footprint MIO.

I just completed all research on the 256k ram card, cad was made to fit in custom case and will be sent off for a small run. This will be the first new Product in a Long time for the 8bit Atari . Anyone interested in the 256k Ramcard Please email me, they will be sold as first come first serve and other runs will come later after a run on the MIO clone.

Thank You,

Atari8man

Hi Mathy,

Yeah the MIO is a mid 1980's scsi device that handles 256k byte sectors only (yuk) , while it maybe hard to find these drives today it's not imposible. It would be nice to re-do the rom to handle 512k byte sectors for newer hard drives. There are other problems with the MIO formater util's I tried to format a 250 meg MFM drive but the drive info would not fit into the MIO menu!! The good thing is every one wants a MIO! and cant find them.
The MIO clone will make these atari user happy.

Atari Bob is right on target!

Down the road there maybe a MIO clone for IDE drives as well.

Thanks!,

Atari8man

Hi,

I would like to see a 3-D Dungeon game, there where many for other platforms
ST/AMIGA/C64 but none for the 8bit Atari, also we do not have any Japanese
/Anime - style (Final Fantasy 1-6) game in our library.
About graphics just look at Tagalon! Just as good as Nes type games or
better even.

Good Luck!

Atari8man

I have played around already with an EPSON RTC and a Lattice ispLSi,
that made the translation.

The EPSON chip has very similar register locations.
If you are interested in, I will have a closer look to it at home.

With two SRAM chips you could have 1MB IIRC. If you don't wanna use SRAM,
concider using 30 pin SIMMs. They don't need much space or power and are dirt
cheap. And easy to replace.

Call me old fashioned, but I'd like to see a combination of the outdoor RPG "Wilderness Campaign", (where you can actually *haggle* with shopkeepers who, if you tick them off, will refuse to sell something to you, characters actually need to eat, and things really do weigh something) and the 3-D dungeon exploring of Akalabeth (the legendary Ultima 0) One thing that I really liked about WC was that you could hire mercenaries to join you. There's nothing like having 40 fighters armed to the teeth to put a bit of confidence in you. Of course, if you don't pay them, they *will* desert you.....

HAT. Perhaps you could receive quests from 'Lord Irish'. <GBEG> For example,

497 PRINT "BRING ME BACK THE ";QUESTOBJECT(QO);", WHICH IS HIDDEN IN ";OBJECTPLACEMENT(OP);" OF ";QUESTPLACE(QP);", AND I WILL GIVE YOU ";MAGICOBJECT(MO);"!"

could give you

BRING ME BACK THE HOPELESS DIAMOND OF BOB, WHICH IS HIDDEN IN THE INNERMOST VAULTS OF PLANET HOLLYWOOD, AND I WILL GIVE YOU THE BOTTOMLESS BOTTLE OF JACK DANIELS!

(Come on, admit it. Haven't we *all* dreamed of owning it at one time or another<G>)

I have the BASIC source code for both 'Wilderness Campaign' and 'Akalabeth' for the Apple 2, and 'Akalabeth' for the PC, which I modified to allow things like saved games and a simple automap. Also, somewhere around here I have a customizable BASIC routine to create multilevel dungeons, complete with stairs, pit traps, one-way doors, etc.. If you would like any of this, just let me know.

I'm not much of a game player, but have you considered supporting the GameLink II/Multidash Interface? If will let you hook up to 8 Atari 8 bit computers together. That way you can have up to 8 players all on their own computer playing against each other. (these computers do have to be in one room (or no further way then approx. 30 meters/33 yards))

I remember back when I had my good ol' Atari 800 set up, I had an alarmingly large amount of adult games, pics, etc. for it. This would always fascinate me, because the notion of someone being turned on by such primitive images seemed ridiculous. Nonetheless, the games were still fun to play and the pics still fun to look at.

Anyway, I just downloaded an emulator and was downloading some of my fave games (JUMPMAN, THE INSTITUTE, MULE, etc...) and I noticed a severe lack of Atari 8-bit porn! Does anybody know where I could get ahold of some good old adult Atari entertainment? It was so easy to get back in the day....

Hi gang! I just came across a few notes from a programming class that I
taught a decade or so ago. Check this out:

DO
.
.
.
LOOP UNTIL X<>0

is the same as

FOR II = 0 TO 1
.
.
.
II=1
IF X=0 THEN II=0
IF Y=0 THEN II=9
IF Y=99 THEN II=10
NEXT II
IF II=10 THEN PRINT "AT BOTTOM"
IF II=11 THEN PRINT "AT TOP"

Neat, eh? A controlled loop w/o any GOTOs needed *AND* exit codes to boot!

A good home. I don't know. But you can probably give the stuff
away, as opposed to putting in trash.
It would maybe sell, if you put a description of what you have, maybe
someone would offer.
E-Bay or other auction has stopped the auctions that used to occur
within this group. Thanks for that.
I'm a bad example, but I offered up my ST stuff here for free and
got several takers. They had to come and pick it up, I certainly
wasn't going to ship it.
If you have a few really juicy items, you might want to try to sell them.
I don't like selling over internet. Risk of too many things happening,
buyer not paying, buyer not satisfied with what he got, shipping, etc.

The pixels in c64 are not 8 bit wide. And the frame rate needs not to be
30 frames, a degrade to 25 or 12.5 (on a PAL machine) still could be
sufficient. If you make 30 frames per second on a 50 hz screen, the
picture suffers from slight sync problems. A PAL video cd has 25 frames
speed.

This code misses the point. It tries to avoid GOTO's because they are bad programming practice. Yet at the same time, changing the for-loop variable II within the loop is also bad programming practice.

it is a question of definition.

There are only 2 digits to hold the year - that is no bug so far.
But if the software will show up "1900" when the byte "00" was returned
by the clock-chip, we have the bug.

So always the question, how the two digit number is interpreted, makes
these things buggy or not.

So here we had a software-bug, but easily to fix.

The ream problem will take place around 2080, but I bet, then not many
RTime8 still will be used :-).

Bye
Matt

There's no problem if M3002 uses windowing. But, if not, we'll end with
registers returning wrong values for day-of-week and wrong leap years.
And if this must be corrected by software, then there's a y2k problem in
M3002 by definition.

I have not tested the RT8 chip yet, but as far as I know most of the
cheap RTC-chips have no leap-year correction for the 00-years, so the
behavior in 2000 was probably right. But that really does not matter,
cause 29.02.2000 is gone now :-)

The second argument:

The M3002 does not calculate the day of the week value itselves. You
have to give an initial value, that is only counted up. So there should
not be any problem with that.

Bye,

Matt

: Ah, you mean a hack ;)

Well, an official hack is called a "patch" :-) It was officially released
by FTe...

: In the docs there are registered described. There is no doubt what
: should be read from them. Anything else done in newer builds of TDLINE
: are just hacks, nothing else. I think my statement about y2k bug in
: R-Time8 is true.

Y2K bug may indeed be true, but could be solved very easily by changing a
few bytes or so (in DOS itself, thus by software). It then works both in
the 20th as in the 21st century.

Note: I do not say it didn't have a Y2K bug. Just that it could be
solved/worked-over by software.

TDLINE already counted past 1999, but did just not display it. It just
showed the ATASCII character that comes right after the zero :-)

They never thought about the fact that people would still be using
Sparta-Dos in the 21st century (shame on them!), so the "date-algorithm"
was just not extensive enough afaik. They fixed that, and now it shows the
right day on top of the screen...

I must disagree with you on two points:

1. Using GOTOs is *not* bad programming practice; using *excessive* GOTOs is. The worst I've ever come across is 5 chained GOTOs - in a *commercial* program (!)that I was hired to *try* to modify. I try to avoid using GOTOs in Applesoft and Atari BASIC because they both use line numbers, and remembering where branches go can make renumbering tricky.

2. Changing programming practice for a specific purpose (i.e. to emulate the DO/LOOP structure) and to add to your general programming strategy, instead of doing it 'just because', *IS* good programming practice, as long as it is clear and consistent. (IMHO)

I will trade Bounty Bob, label normal used condition, no tears or edgewear,
only very minimal glue spotting.

I will trade for any of the following ORIGINAL game carts (no copies!):

Tapper
Pharoas Curse
Zeppelin
Matterhorn

Not interested in any other trades at this time so please e-mail me only if
you want to trade one of these games on my list for Bounty Bob.
Thanks. -Satcom2

I would be satisified with an Ultima-type game as I played Ultima 1-3
on the Atari 8-bit. However, if you think you could program something
better like a DM-type or Final Fantasy-type game for the 8-bit, that
would be wonderful. I would pay good money for a good RPG game for the
8-bit. It would bring back the old times I dearly miss.

I must disagree also. I would never modify a FOR loop
variable since it is possible that you will never leave the
loop. I think I would rather put up with the GOTO and
the line numbers than violating a structure such as FOR.
It defeats the purpose. If you want to emulate a While/
Wend or a Repeat/Until, there are better ways.

10 X=0
20 REM do some stuff
30 IF X<>some condition then goto 20

Is similar to a Until structure since it is a post loop test
and you could write pre-loop testing as well.

10 X=0
20 IF X=some condition THEN goto 50
30 REM do some stuff
40 GOTO 20
50 REM continue

Pekka "Pihti" Takala wrote:

PT> The pixels in c64 are not 8 bit wide.

As 8 bits is the smallest unit that the processor can work on it'd be ideal if it had 8 bits per pixel. In this case, writing pixels in bitmap mode actually requires MORE instructions than if we'd have had a straight 256-colour mode. Besides, as you decode the stream you will get 24-bit pixels that you'll have to map onto the C64's 16-colour palette.

PT> And the frame rate needs not to be 30 frames, a degrade to 25 or
PT> 12.5 (on a PAL machine) still could be sufficient.

You can get away with displaying fewer frames per second, but you still need to decode all the frames in memory. MPEG frames can reference both backwards and forwards so you need to keep the last two I frames and everything in between in memory.

PT> If you make 30 frames per second on a 50 hz screen, the picture
PT> suffers from slight sync problems. A PAL video cd has 25 frames
PT> speed.

Yes, but it has 288 lines instead of 240 so you have the same amount of pixels and the same data rate:

352 x 288 x 25 fps = 2534400 pixels/second
352 x 240 x 30 fps = 2534400 pixels/second

With 20000000 cycles per second that leaves you with just under 8 cycles per pixel, and that's not even enough for LDA + STA. And don't forget SuperRAM DRAM latency and the fact that you can't write to the C64's internal memory more than once every 20 cycles.

MV> Not compared to a 6502 derivate, no.

PT> How a 6502 derivate is crap?

Same way an x86 derivate is crap: non-orthogonal instruction set, not enough registers and a memory model that is based on 64K pages.

PT> So I think it _is_ possible to use the 20 mhz 65816 upgrade to
PT> decode a vcd.

MV> Not in real time. Not even close.

PT> I think it _is_ possible if the data transfer methods are fast
PT> enough.

The fastest storage we have on the C64 is the CMD RamLink. With a SuperCPU the fastest transfer rates anyone's been able to achieve is about 150-200 kB/s. This is a straight copy from RamLink memory using a SuperCPU with 100% CPU utilization. Oh, and a RamLink can't use more than 16 MB of RAM for a total of 1.5 minutes MPEG 1 video.

PT> But you are correct in one thing: it takes much processing power.

Yes -- too much. Do the math, there's no way in hell you can decode VCD streams at full speed on a SuperCPU.

All Video Game Advantage (VGA) FS/T lists are updated approximately
every ten days available on the WWW at http://www.io.com/~vga2000/

*IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT*

The 'Sale Conditions' and 'Ordering Instructions' sections are at
the end of this message. Please read them both carefully *BEFORE*
asking any questions, or placing any orders. Thank you!

*IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT*

This list was last updated on 07/04/2001

NOTE: There are currently 1958 ORIGINAL game screen shots available
on my web site, including 52 for the Atari 8-bit computers!

NOTE: There are currently 857 game manuals available on my web site.
Unfortunately, none are for the Atari 8-bit computers, at this time...

NOTE: The Video Game Advantage Definitive Known Software List
Collection list for this system is currently on-line!

I have the following Atari 8-bit software, hardware, and accessories
for sale or trade.

There are a few items that are listed as untested. When I bought
these items I was told that they all worked, but due to a lack of
time, I have been unable to test them myself.

SOFTWARE:

NOTE: If the company name isn't listed, then the game was released
by the same company as the system.

NOTE: All cartridges are loose (ie. without box and manual), unless
specified.

NOTE: Since all cartridges are used, some labels will have small
defects. Major defects will be listed.

ATARI 8-BIT COMPUTER:

Loose cartridges, no box or manual:
$ 2.00 Missile Command
$ 1.50 Space Invaders
$ 3.00 2-pack: Missile Command and Space Invaders

Accessories:
$ 1.00 "A Note Regarding Software" letter: Atari Home Computers
-- some rips
$ 4.00 Atari 1010 Program Recorder Owner's Guide (16 pages)
$ 4.00 Atari 1200XL Home Computer Owner's Guide (20 pages)
$ 8.00 Atari 65XE Personal Computer Owner's Manual (138 pages)
$ 4.00 Atari 800XL Home Computer Owner's Guide (24 pages)
$ 4.00 Atari BASIC Reference Guide: For Experienced Programmers
(16 pages)
$ 2.50 Atari Home Computers: The Next Generation catalog
(32 pages)
$ 8.00 2-pack: Atari Disk Operating System Reference Manual:
DOS 3 (112 pages). Lot also includes An Introduction
to the Atari Disk Operating System: DOS 3 (32 pages)
$ 8.00 Inside Atari BASIC [Atari / Reston] (196 pages)

[Pictures of the items listed below will be available soon]

HARDWARE:

NOTE: The Lots listed below include only what is listed!

LOT #1

ATARI 1050 (127K) DISK DRIVE.

This disk drive does not include the power supply, or Molex
connector cable.

NOTE: Light comes on, and drive tries to read disk, but drive will
not boot up. Sold as non-working item, possibly repairable, for
parts only!

$ 2.00

*****

LOT #2

ATARI 1025 PRINTER, with built-in power cord, and manual.

This item has not been tested.

I have plugged in this printer, and after powering it up the power
light came on and the print head moved.

$ 7.00

*****

SALE CONDITIONS:

1) Sales are first come, first served. If you are looking for
something that isn't listed, please don't ask (because if I
had it, I'd list it).

2) Everything is sold as is. Unless specified, all games and systems have been tested and are in working order. I very rarely sell items that aren't working, but if I do, they are clearly labeled as such.

3) Trade offers, in particular for items that I need, will be considered (especially if the trade offer overwhelms me). I collect for over 50 different systems, so please feel free to send me a trade list. My want lists are on my web site.

4) Buyer has ten (10) days to send payment, and pays all shipping costs. Shipping cost depends on both the weight of the order and the distance that the order must travel, unless a set amount is already listed. No orders will be sent C.O.D.

5) Since items will be held specifically for you, if you aren't serious about buying, please don't place an order!

6) No package deals on games or systems. All prices are clearly listed. There is no minimum order.

7) If you have a problem with the listed price, please remember that nobody is forcing you to buy from me. I have been in business since 09/05/93, so I have a good idea how to price items. My personal philosophy is that something is only worth what someone is willing to pay for it.

8) Payment must be made in U.S. funds (either check, money order -drawn from a U.S. bank branch-, or cash. Orders from outside the U.S. are also accepted (also, please check out my want lists, since some items are only available outside the U.S.)

9) I reserve the right to refuse any sale or trade offer, and to correct mistakes made while typing this message.

*****

ORDERING INSTRUCTIONS:

To reserve any item(s) listed here, please do the following:

1) carefully read the SALE CONDITIONS section first,
2) please make sure that you are going to follow through on your order *BEFORE* you place it,
3) next e-mail me a list of the items that you are interested in (please quote from the FS/T message, but not the entire thing!),
4) also include your full name and full postal mailing address (this information is for internal VGA use only, and is REQUIRED!),
5) I will reply with a shipping information message for your order.

Thank you!

> CU Mathy van Nisselroy

Jeff P. and I were both working on different versions of hardware while MOA was being written. The paperclip version was a simple method anyone could do without anything else. The drawback to a 6 to 8 port hub, is when its owner leaves, the game ends.

My thinking for 8 computers max is that the 7 slaves are treated as disk drives so they can boot from the master computer. The OS only has provisions for numbering 8 SIO drives-device IDs 49 to 56. At 64 you hit printer IDs. I haven't looked at the GLII code so don't know for sure. What I do know, if you can get 8 people together to play at one time, you win 1st prize!

Its not futile. Many want to have 64K in their 600XL.

I typed in an article with much the same upgrade David P. posted, but from MACE
& WAUG, By Don Neff, June 1988.
And it has some diagrams with it.

Since it happens with/without the upgrade, I'd suspect the ram chips. You may
need to open the computer and reseat all of the socketed chips.

....

Besides, Applesoft BASIC does not have all that many control structures;
so, some fudging on 'good practice' rules is unavoidable.
```

Changing the loop index within the loop in order to force (or avoid) an exit at the NEXT test is a fairly common practice. On the other hand, exiting a FOR-NEXT via an IF-THEN GOTO is common, too. In either case, you have something of a loop violation.

This way of extending the use of FOR-NEXT is kind of neat, at least as an option to consider. You will lose a bit of speed and compactness; but, you may gain improved modularity and easier to follow code.

Subject: 0.1) Table of contents

0.1) Table of contents

The Computers
1.1) What is an Atari 8-bit computer?
1.2) What is the Atari 400?
1.3) What is the Atari 800?
1.4) What is the Atari 1200XL?
1.5) What is the Atari 600XL?
1.6) What is the Atari 800XL?
1.7) What is the Atari 65XE?
1.8) What is the Atari 130XE?
1.9) What is the Atari 800XE?
1.10) What is the Atari XE Game System?
1.11) What are the ANTIC, CTIA/GTIA, POKEY, and FREDDIE chips?
1.12) What is the internal layout of the 8-bit Atari?
1.13) What are the pinouts for the various ports on the Atari?

Video Display
2.1) What kinds of monitors can I use with my Atari?
2.2) What is the difference between NTSC and PAL machines?
2.3) Is the software for the Atari 8-bit computers "TV-standard dependent?"
2.4) What are the PAL, NTSC and SECAM video broadcast standards?

Mass Storage
3.1) What are the Atari 410, 1010, and XC12 Program Recorders?
3.2) How do I run a program from cassette?
3.3) What are the Atari 810, 1050, and XF551 Disk Drives?
3.4) What floppy disk drives can I use with my Atari?

3.5) What kinds of 5.25" floppy disks can I use with my Atari drives?
3.6) What do I need to connect a hard drive to my 8-bit Atari?

Printers
4.1) What are the Atari 820, 822, and 825 Printers?
4.2) What are the Atari 1020, 1025, 1027, and 1029 Printers?
4.3) What are the Atari XMM801 and XDM121 Printers?

Modems
5.1) What are the Atari 830, 835, 1030, XM301, and SX212 Modems?
5.2) What should I know about modems and the Atari?

More hardware
6.1) What is the Atari 850 Interface Module?
6.2) What is the Atari XEP80 Interface Module?
6.3) What accessories did Atari produce for their 8-bit computers?
6.4) What "vaporware" computers/peripherals were never released?
6.5) What are the power requirements for my Atari components?

Core software: OS, BASIC, DOS
7.1) What versions of the Atari Operating System (OS) are there?
7.2) What versions of Atari BASIC are there?
7.3) What are Atari DOS I, DOS II v2.0S, DOS III, DOS 2.5, and DOS XE?
7.4) What's the best DOS for the Atari?
7.5) How do I modify Atari DOS to support more than two drives?
7.6) Are there Graphical User Interfaces (GUIs) for the Atari?

Software
8.1) What are the best terminal emulators available?
8.2) What BBS software can be used on the Atari?
8.3) What programming languages are available for the Atari?
8.4) What cartridges were released for the Right Slot of the 800?
8.5) What games support 4 or more simultaneous players?
8.6) What programs run only on the 400 and 800 models, and why?
8.7) What programs make use of the Light Gun or a light pen?
8.8) What programs have a track ball mode or support a mouse?
8.9) What programs have a paddle(s) or Koala Pad mode?
8.10) What programs have a CX85 mode?
8.11) What programs have a Touch tablet mode?

File Formats
9.1) What's this UUEncoding stuff (.uu, .uue files) all about?
9.2) What is an .arc file?
9.3) What are the .DCM, .ATR, .XFD, .SCP, and .DI disk image formats?
9.4) What are the .XMO and .BIN file formats?
9.5) How can I make my commercial boot disk (tape, cart) into a load file
or disk image?
9.6) How can I convert my commercial boot tape into a cassette image file?

File Transfer Solutions
11.2) Can I read/write 8-bit Atari disks on an IBM-PC?
11.3) How do I transfer files using a null modem cable?

11.4) What is SIO2PC?
11.5) What is the Atari Peripheral Emulator (APE)?

"leftovers"
13.19) What's the difference between ASCII and ATASCII?

Timeline
15.1) How did Atari get it's name?
15.2) What is the History of Atari?

Subject: 1.1) What is an Atari 8-bit computer?

Based in Silicon Valley in the U.S.A., the company known as Atari produced a line of home computers from 1979 to 1992 often referred to collectively as the "Atari 8-bits," the "8-bit Ataris," the "400/800/XL/XE series," etc.

The computers included the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System.

These machines competed in the marketplace with the likes of the Commodore 64 series, the Apple II series, the Texas Instruments TI99/4A, and the Radio Shack Color Computer. Of these, the 8-bit Atari is most similar to the Commodore 64.

The 8-bit Atari computers are not software compatible with other Atari platforms, such as the 2600 Video Computer System (VCS), the 5200 SuperSystem, the 7800 ProSystem, or the ST/TT/Falcon computers. All of these but the 5200, however, do share the same joystick/controller hardware port.

Here are some of the performance specifications of the 8-bit Atari:

(Some of this text by Bill Kendrick.)

CPU: 6502 (MOS Technology)
CPU CLOCK SPEED:
NTSC machines: 1.7897725 MHz
PAL machines: 1.773447 MHz

SCREEN REFRESH RATE:
59.94 times per second (Hz) on NTSC Ataris
49.86 Hz on PAL machines

GRAPHICS MODES:
ANTIC CIO/BASIC Display Resolution Number of
Mode # Graphics # Type (full screen) Colors

F 11 + Map 80 x 192 16 ***
* 1 Hue; 2 Luminances
** 1 Hue; 16 Luminances
*** 16 Hues; 1 Luminance
+ require the GTIA chip. 1979-1981 400/800's shipped with CTIA
++ Not available via the BASIC GRAPHICS command in 400/800's.

GRAPHICS INDIRECTION (COLOR REGISTERS AND CHARACTER SETS):
Nine color registers are available. Each color register holds any of 16 luminances x 16 hues = 256 colors. (Four registers are for player-missile graphics.

Character sets of 128 8x8 characters, each with a normal and an inverse video incarnation, are totally redefinable.

PLAYER-MISSILE GRAPHICS:
Four 8-bit wide, 128 or 256 byte high single color players, and four 2-bit wide, 128 or 256 byte high single color missiles are available. A mode to combine the 4 missiles into a 5th 8-bit wide player is also available, as is a mode to XOR colors or blacken out colors when players overlap (good for making three colors out of two players!) Players and missiles have adjustable priority and collision detection.

DISPLAY LIST INTERRUPTS (DLI's):
Screen modes can be mixed (by lines) down the screen using the Display List - a program which is executed by the ANTIC graphics chip every screen refresh:

All other screen attributes (color, player/missile horizontal position, screen width, player/missile/playfield priority, etc.) can be ajusted at any point down the screen via DLI's.

SCROLLING:
Fine scrolling (both vertical and horizontal) can be enabled on any line on the screen.

SOUND:
Four voices of 8-bit pitch-resolution, 4-bit volume-resolution, 8-distortion sound can be produced. 2 voices (1 and 2, and/or 3 and 4) can be combined to make 16-bit pitch-resolution. Also 4-bit volume-only modes can be enabled for digitally sampled sound replay.

A fifth "voice" is produced by the internal speaker on Atari 400/800's (for keyclick and buzzer) and in the XL's and XE's this was (fortunately!) rerouted through the normal audio output, and the keyclick can be disabled.

Subject: 1.2) What is the Atari 400?

Released along with the 800 in 1979, the 400 was the low-end model of the two. The only 8-bit Atari with a membrane keyboard rather than a full-stroke keyboard. One of the few 8-bit Ataris lacking a composite monitor port. Originally released with just 8K RAM, but most were sold with 16K RAM. There was also a factory-authorized 48K upgrade available through dealers.

Only the 400 and 800 8-bit Atari models have four controller (joystick) ports.

Early 400 units include the CTIA chip; later units include the GTIA chip, also present in all later 8-bit Ataris.

The 1982 Atari catalog calls the 400 "The Basic Computer".

The 400 was discontinued in 1983.

During development the 400 was known internally as "Candy."

Subject: 1.3) What is the Atari 800?

Released along with the 400 in 1979, the 800 was the high-end model of the two. The 800 is the only 8-bit Atari with a Right Cartridge slot, in addition to the Left Cartridge slot as present on all 8-bit Ataris. Originally released with just 8K RAM, many were sold with 16K, later on 48K was standard.

The 800 is also the only 8-bit Atari with a four-slot modular design, where the first slot holds the CX801 (CX801-P for PAL machines) 10K ROM module, and the other three slots hold combinations of CX852 8K or CX853 16K RAM modules.

Only the 400 and 800 8-bit Atari models have four controller (joystick) ports.

Early 800 units include the CTIA chip; later units include the GTIA chip, also present in all later 8-bit Ataris.

The 800 was discontinued in 1983.

During development the 800 was known internally as "Colleen."

Subject: 1.4) What is the Atari 1200XL?

Released as a big brother to the 400/800 in 1982, the 1200XL now uses Atari's slightly customized 6502C microprocessor, and includes a full 64K RAM. The 1200XL was the first 8-bit Atari with just 2 controller ports. In addition, the 1200XL includes 4 programmable Function keys and a Help key, 4 LEDs, built-in diagnostic and graphics demonstration programs, and probably the

favorite keyboard of any 8-bit Atari computer. Clicks previously outputted through the built-in speaker are now heard from the television or monitor's speaker. The revised 16K Operating System offers many new features, including an alternate International Character Set.

The 1200XL was the biggest single step forward in development of the 8-bit Atari platform, but the corresponding software compatability problems hurt its popularity.

The 1200XL lacks separate chroma video signal, and also lacks the +5 Volts power on pin 10 of the SIO port.

The 1200XL was discontinued in 1983.

Subject: 1.5) What is the Atari 600XL?

Released in 1983 as a replacement for the 400, the 600XL is the low-end version of the 800XL. The 600XL/800XL include most of the features of the 1200XL minus the Function keys and the demo program. But both the 800XL and 600XL have the Atari BASIC language built-in. In addition, these two systems offer the Parallel Bus Interface (PBI), providing fast parallel access to the heart of the computer. The 600XL has 16K RAM.

The 600XL can be expanded from 16K to 64K with the Atari 1064 Memory Module.

Normally boots with Atari BASIC (Revision B) enabled;
Hold down [Option] on startup to boot without BASIC.

The 600XL lacks separate chroma video signal.

The 600XL was discontinued in 1985.

Subject: 1.6) What is the Atari 800XL?

Released in 1983 as a replacement for the 800 and 1200XL, the 800XL is the high-end version of the 600XL. The 600XL/800XL include most of the features of the 1200XL minus the Function keys and the demo program. But both the 800XL and 600XL have the Atari BASIC language built-in. In addition, these two systems offer the Parallel Bus Interface (PBI), providing fast parallel access to the heart of the computer. The 800XL contains 64K RAM.

Normally boots with Atari BASIC (Revision B) enabled;
Hold down [Option] on startup to boot without BASIC.

The 800XL lacks separate chroma video signal.

There was a late version of the 800XL in Europe, called 800XLF. The 800XLF includes a redesigned motherboard (a la the XE computers) and contains FREDDIE for memory management and has chroma output. BASIC is Revision C.

Though Atari never disclosed sales figures, the 800XL was likely the most-sold of all 8-bit Atari computer models.

The 800XL was discontinued in 1985.

Subject: 1.7) What is the Atari 65XE?

Released in 1985 as a replacement for the 600XL, the 65XE is the low-end
version of the 130XE. The 65XE is nearly identical to the 800XL in features,
minus the PBI. European 65XE's include the ECI port, present only on the
130XE in North America. All XE computers also include the FREDDIE memory
management chip.

Normally boots with Atari BASIC (Revision C) enabled;
Hold down [Option] on startup to boot without BASIC.

The 65XE was discontinued in 1992.

Subject: 1.8) What is the Atari 130XE?

Released in 1985 as a replacement for the 800XL, the 130XE is the high-end
version of the 65XE. The 130XE offers 128K RAM, plus the FREDDIE memory
management chip, supporting the unique (but rarely used) ability for the 6502
and the ANTIC to independently access RAM banks. In addition, the 130XE
replaces the PBI port with the Enhanced Cartridge Interface (ECI), continuing
the powerful feature of a fast parallel port.

Normally boots with Atari BASIC (Revision C) enabled;
Hold down [Option] on startup to boot without BASIC.

The 130XE was discontinued in 1992.

Subject: 1.9) What is the Atari 800XE?

Unseen and unknown in North America, the 800XE is identical in features
to the European version of the 65XE. Which means it could also be described
as a 64K version of the 130XE.

Normally boots with Atari BASIC (Revision C) enabled;
Hold down [Option] on startup to boot without BASIC.

Jindrich Kubec writes, "The problematic Chinese 800XEs with GTIA problems were
manufactured in 1992."

The 800XE was discontinued in 1992.

Subject: 1.10) What is the Atari XE Game System?

In a change of marketing strategy, Atari introduced the new XE Game System
in 1987. Despite its label, the XEGS is a true 8-bit Atari computer system.
It offers the convenience of a detachable keyboard and built-in
Missile Command game (hold down Select at startup), while offering 64K RAM

and full compatibility with the 65XE. It was packaged with the Light Gun,
and the Flight Simulator II and Bug Hunt cartridges.

James Bradford offers:
With the keyboard connected and no cart, basic boots, with out a
keyboard connected and no cart, the built in game runs.
There is only 1 32K ROM in the XEGS, it has the OS, BASIC (Rev C) and
Missile Command on it.

The XE Game System was discontinued in 1992.

Subject: 1.11) What are the ANTIC, CTIA/GTIA, POKEY, and FREDDIE chips?

The following four paragraphs were written by Chris Crawford and appear in De
Re Atari (Atari#APX-90008), a book published and copyright by Atari, Inc.,
1981-1982. The text been very slightly modified here for generality.

"The internal layout of the Atari 8-bit computer is very different
from other systems. It of course has a microprocessor (a 6502), RAM,
ROM, and a PIA. However, it also has three special-purpose (LSI) chips
known as ANTIC, GTIA, and POKEY. These chips were designed by Atari
engineers primarily to take much of the burden of housekeeping off of the
6502, thereby freeing the 6502 to concentrate on computations. While
they were at it, they designed a great deal of power into these chips.
Each of these chips is almost as big (in terms of silicon area) as a
6502, so the three of them together provide a tremendous amount of
power. Mastering the Atari 8-bit computers is primarily a matter of
mastering these three chips.

ANTIC ("Alpha-Numeric Television Interface Circuit") is a microprocessor
dedicated to the television display. It is a true microprocessor; it has an
instruction set, a program (called the display list), and data. The display
list and the display data are written into RAM by the 6502. ANTIC retrieves
this information from RAM using direct memory access (DMA). It processes the
higher level instructions in the display list and translates these instructions
into a real-time stream of simple instructions to GTIA.

CTIA ("Color Television Interface Adapter") / GTIA ("George's Television
Interface Adapter") is a television interface chip. ANTIC directly controls
most of GTIA's operations, but the 6502 can be programmed to intercede and
control some or all of GTIA's functions. GTIA converts the digital
commands from ANTIC (or the 6502) into the signal that goes to the
television. GTIA also adds some factors of its own, such as color
values, player-missile graphics, and collision detection.

POKEY (means "POT and KEY" as in the paddles and keyboard) is a digital
input/output (I/O) chip. It handles such disparate tasks as the serial I/O
bus, audio generation, keyboard scan, and random number generation. It also
digitizes the resistive paddle inputs and controls maskable interrupt (IRQ)
requests from peripherals.

All four of these LSI chips function simultaneously. Careful
separation of their functions in the design phase has minimized conflicts
between the chips. The only hardware level conflict between any two
chips in the system occurs when ANTIC needs to use the address and data
buses to fetch its display information. To do this, it halts the 6502
and takes control of the buses."

6502--MORE:
While the 400/800 models contain a generic 6502B CPU (a faster version of the
original 6502A microprocessor), all of the XL/XE models contain Atari's
customized 6502C chip.

On the Atari, there are two microprocessors, ANTIC and the 6502. To
allow them to coexist, ANTIC must shut off the 6502, a process called
DMA. The 6502B supports DMA, but in Atari's implementation, it required 4
chips. The 6502C has an extra line called HALT. It is controlled by ANTIC
which uses it whenever it needs the data/address bus. The HALT line is on pin
35 of the Atari 6502C and must be pulled high for the chip to work.

FREDDIE:
The 65XE/130XE/800XE/XEGS contain a small additional LSI called FREDDIE, a RAM
address multiplexer. According to James Bradford, "FREDDIE is a type of
memory controller. It takes the address and clock from the CPU and
multiplexes it with the appropriate timings and signals to use DYNAMIC memory.
FREDDIE also buffers the system clock crystal and divides it down then feeds
that to GTIA. The XEGS has a FREDDIE but it doesn't have the extended RAM.
Even if it did, you would still need the chip that does the REAL bank
switching. It is a small 16-pin chip (Atari/Best Electronics catalog number
CO25953: rev9/page 42). It gets RAS from FREDDIE, the bank select bits from
PIA, A14, A15 and the 6502 halt signal to control which bank of 8 chips RAS
goes to. A14 and A15 then go to FREDDIE for the address range of the extra
memory bank (or normal address range with no bank switching). The ANTIC/6502
select bits in combination with the 6502 halt line, control the switching of
the PIA bank number bits to A14/A15 and which bank of memory RAS goes to. Why
people say FREDDIE does the bank switching is beyond me. An 800XL can look
like a 130XE with that 16-pin chip installed (That's right NO FREDDIE) and an
extra 8 RAM chips."

And more recently James Bradford has written:
FREDDIE is just a memory decoder and timer. It replaces several chips in the
800xl The small chip near FREDDIE does all the bank selection.CO25953. One line
from FREDDIE , Ras (or is it cas?) goes to this chip, Halt and the bank
/processor select lines go into this same chip and ras (cas?) comes out. a pin
for each bank. If i remember correctly, refresh also goes into this small chip.
It would be quite easy to make an 800xl work just like a 130xe with this chip
since Ras (Cas?) is required by ALL dynamic ram.

GTIA--MORE:
In BASIC, type POKE 623,64 [RETURN] and if the screen blackens, you have the
GTIA chip. If it stays blue, you have the old CTIA chip.

By the way, apparently no CTIA-equipped Ataris were shipped to Europe.

Clay Halliwell provides this tidbit:
A bit of trivia: CTIA 400/800s artifacted in blue/green, GTIA 400/800s artifacted in green/blue, and all XL/XEs artifact in red/blue.

Jerry Jessop explains why French Ataris produce fewer colors:

"I will tell you why it only has monochrome out, because it's SECAM and a SECAM GTIA was never produced. The PAL GTIA is used in France and the Lum outputs are run into an onboard encoder to produce a "psudo" color depending on the Luminance output, composite only. This is why a SECAM VCS or 800 has nowhere near the same number of colors (16) availible as a PAL or NTSC unit (256).

> Jindrich Kubec interjects: (5/12/01)
> This is questionable. There's at least one SECAM computer with SECAM
> GTIA part no. C020120. On the other hand it's maybe prototype. (Curt
> Vendel has it on his site).

The FGTIA was never completed as the market size did not warrant the expense. The largest SECAM market is not France but the Soviet Union (former) and in 80-84 sales of these items there were not possible."

Andreas Magenheimer writes:
All of these newer and buggy GTIA`s were built with the "eastern european" XE computers. they were made in China. Although Atari knew about this, they did not change them. so you have to replace them with older XL/XE GTIA chips...

But one more thing to GTIA and ANTIC chips: All PAL versions of these chips have a color bug, since gr. 11 produces 16 colors, but merely 15 different colors (one color: brown at the beginning and end of the palette is absolutely the same; normally there should be a red tone here !); with gr. 9 you will see 16 shades, but merely 15 different shades (the same as gr. 11, one shade is doubled!).

Strange enough, I also found this color bug to appear in PAL ANTIC chips, there is also the red tone missing (and the brown one doubled !). This color bug appears in all PAL ANTIC and especially GTIA chips. Atari never fixed it, so you find it inside any GTIA equipped PAL Atari 800 and also the later XL and XE models. Since PAL users have to live with this bug, they sometimes do programs which look absolutely strange on NTSC and vice versa (not to mention the different Herz frame 50/60 hz and higher PAL line resolution/overscan).

Imagine the following: a PAL GTIA has 15 colors in gr. 11
a NTSC GTIA has 16 colors in gr. 11
a PAL GTIA has 15 shades in gr. 9
a NTSC GTIA has 16 shades in gr. 9

Thus, a combination of gr. 9 and 11 gives:
16x16 = 256 colors on NTSC
15x15 = 225 colors on PAL

And - as said before, the bug seems also to appear with ANTIC...
Bad luck, we PAL users... Greets - Andreas Magenheimer.

Jindrich Kubec provides another opinion: (5/12/01)
"ANTIC has nothing to do with colors. So it can't have any color bug.

The colors are generated in this way: color 0 is not a color. So it leaves us with 15 colors. Imagine it as a color circle. And each color is generated with some shift. (360 / 15 degrees). It seems that the value was selected incorrectly for PAL so that the first (color 1) and last (color 15) are same or almost same.

I haven't noticed any problems with shades in graphics 9.

Thomas Richter interjects: (5/12/01)
> I did, happens on my (PAL) 800XL in Gr.9. Grey shapes 7 and 8 are
> identically. I would guess the problem is a poorly adjusted D/A converter.

Jindrich:
> I should test this. But the luminance circuits should be same for PAL &
> NTSC.

Thomas:
> Other strange effects happen if you place a shape 7 pixel near a shape 8
> pixel, it looks like a faint vertical line of a slightly darker shape.
> Most likely a capicity/charge problem in the D/A converter (note that the
> output of every single bit gets reversed!)

Jindrich:
> Yes, I notified this many times.
>
> But there is nothing like adjustable D/A converter ;) There are four
> outputs of GTIA called LUM0-LUM3. They are amplified, run thru four
> different resistors (36k, 18k, 9k1, 4k7) and the lines are then
> connected together with CSYNC. The output goes to some analog circuit
> (amplifier?) and out goes the luminance signal.

Thomas:
> This *IS* the D/A converter. (-;

Jindrich:
> But it's not adjustable ;)

Greg Menke:
> Sure it is, just change the resistors- 10 turn pots with the center
> values more or less equivalent to the respective resistors would
> probably do it.

Jindrich Kubec adds:
"The other thing is real existing GTIA problem in latest revisions of China produced XEs, where GTIA modes have problem that 2 of 4 subpixels of pixel have invalid luminance."

Technical data and schematics for the ANTIC, GTIA, and POKEY chips are available on Curt Vendel's web site, thanks to permission from Hasbro's

Atari Interactive Divisions release of this data. See:

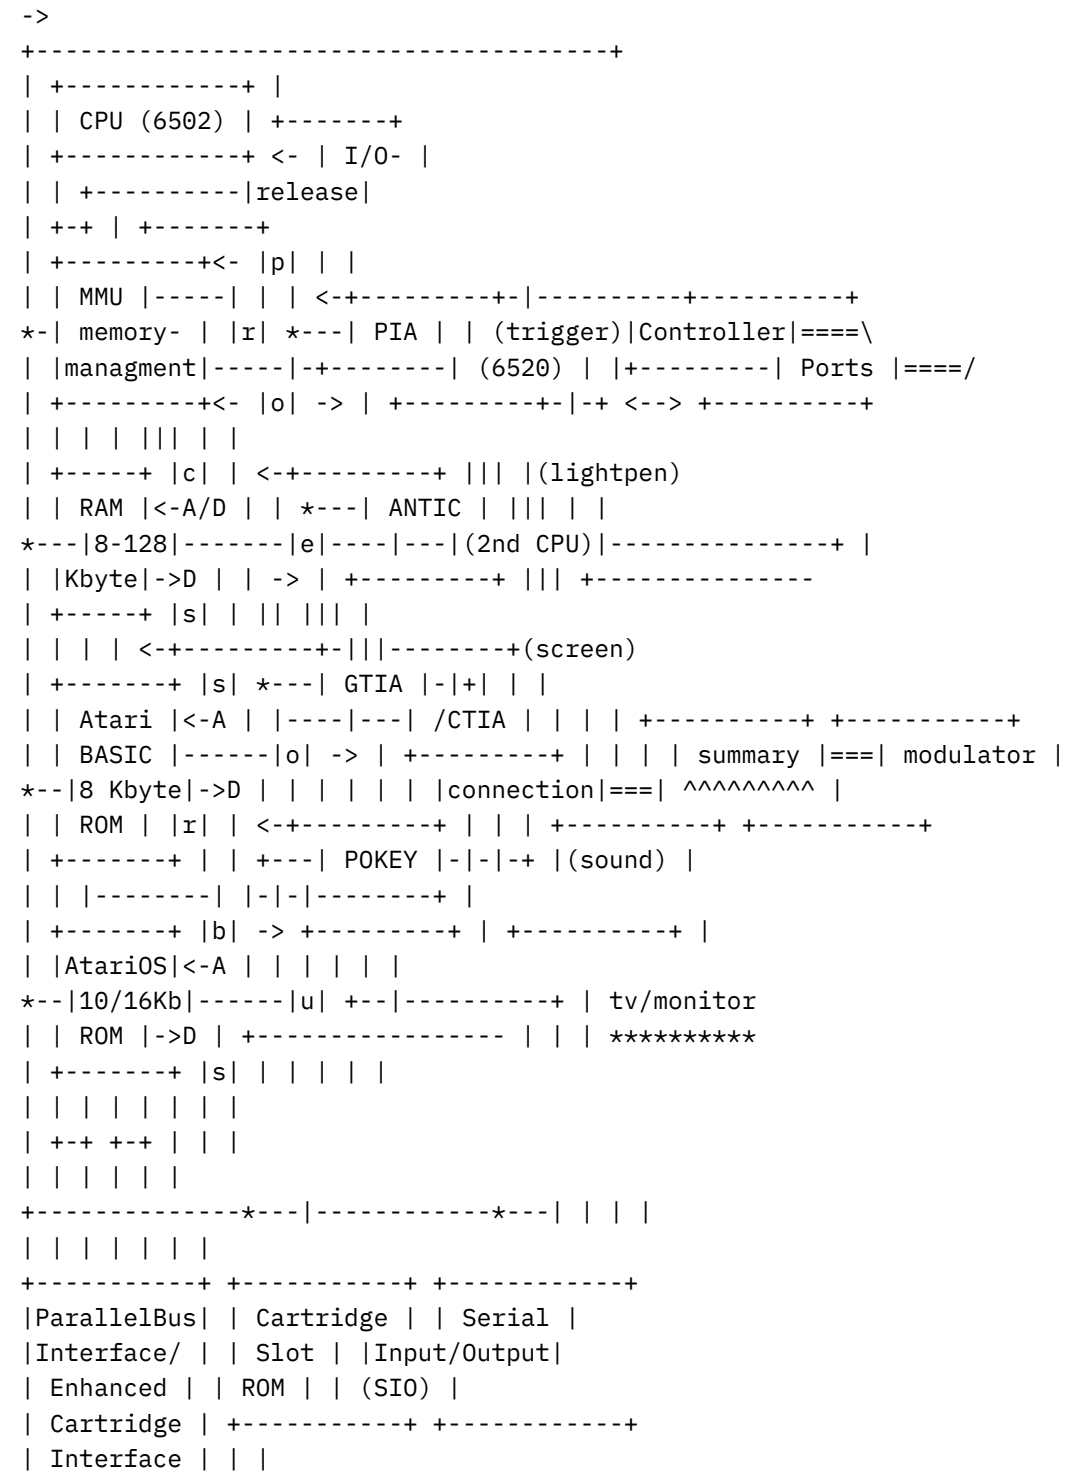
Subject: 1.12) What is the internal layout of the 8-bit Atari?

ASCII art by Thomas Havemeister.



+-----------+ | |
| | |
- memory expansion -cartridge with - disk drive
- Z80 card programs - printer
- 80 char card (games , dos) - modem

NOTES
* RAM: 400/800: 8K, 16K or 48K standard
600XL:16K standard
1200XL/800XL/65XE/800XE/XEGS: 64K standard
130XE:128K standard
* ROM: 400/800:10K OS, 1200XL:16K OS, all others:16K OS + 8K Atari BASIC
* CPU: 400/800:6502B, all others:6502C
* 800 includes two Cartridge Slots, all others include one
* early release 400/800 have CTIA instead of GTIA
* 400/800 have 4 Controller Ports, all others have 2
* PBI is on 600XL/800XL only
* ECI is on 130XE/800XE/European 65XE only
* Some late XE's use a 68B21 for PIA; PIA is 6520/6520A on all others

The following are most of the team who originally designed the 400/800.
Credit for providing this information for the FAQ goes to:
Doug Neubauer (by way of James Finnegan), Jerry Jessop, Scott Emmons

VLSI HARDWARE:
Jay Miner - Creator and System architect, VSLI manager
Steve Mayer - Also one of the creators - Partner in "Cyan Engineering"
Lawrence D. Emmons - Also one of the creators - Partner in "Cyan Engineering"
Joe Decuir - ANTIC and system and creator
???A French guy - ANTIC logic designer
George McLeod - CTIA and GTIA logic design
Doug Neubauer - POKEY logic design
Mark Shieu - POKEY chip design
Steve Stone - POKEY layout design
Steve Smith - Technician for ANTIC and GTIA
Delwin Pearson - Technician for POKEY

Subject: 1.13) What are the pinouts for the various ports on the Atari?

Controller Port (4 on 400/800, 2 on all others):

Subject: 2.1) What kinds of monitors can I use with my Atari?

In general, you either need a Composite Video monitor, or a standard TV.

Standard Television:
You'll need an RF (radio frequency--video and audio signals in the same line) video cable (not detachable on the 400/800), and a TV Switch Box which allows connection either to the VHF input or to the cable input on the TV. Used with VHF Channel 2 or 3.

Monitor:
The 8-bit Atari produces a color Composite Video signal, plus separate chroma (color) and luminance (brightness) signals which the best composite video monitors can take advantage of. Popular examples of such monitors include the family of monitors produced by Commodore.

Gotcha's:

-the 400 and North American 600XL lack a monitor port entirely. They can only be used with a TV.

-the XE Game System provides an RCA-style jack in place of the Monitor port; so it provides Composite Video but lacks separate chroma\luma signals

-the 600XL, 800XL and 1200XL lack separate chroma signal (can be added via hardware modification)

-the XEP80 Interface Module produces a monochrome Composite Video signal via an RCA-style jack. This higher-resolution signal produces crisp, clear 80 column text on 80-column monochrome composite video monitors.

The pinout of the Monitor port is in the pinout section of this FAQ list. The monitor connector on the back of the Atari can be utilized using a 4-pin DIN to RCA converter. You don't need to build a separate cable.

Brent Buescher, Jr. writes:

"The best monitor for an Atari 8 bit that is readily available today would be a television with an S-video input---these tend to be large and high-quality, so the s-video input is the deciding factor there. You'll have to build the cable yourself, and if you have an XL you'll want to do the Super Video upgrade that Ben Poehland published in Atari Classics a few years ago---this

puts the chroma signal back on the pin that it should be and cleans up the video signal enormously. It's really more of a fix than an upgrade.

I use a commodore split-video monitor. They work great and are cheap-to-reasonable when you can find them."

Bryan Edewaard writes:

"Yes, the best choices are monitors that support "Separated Video" (sometimes called Commodore video on Commodore monitors), or S-Video. These monitors have separate color and luminance video inputs, which give a sharper picture without cross-color artifacts - such as the colored fringes on text when viewed on a TV (although some games use these artifacts to get additional colors). If you have an XL computer, then it needs an upgrade to support these monitors due to the omission of chroma from the monitor port. the 800 and XE computers don't have this problem.

The 2nd best choice is a TV or monitor that has a "Composite Video" (usually called just "Video" or "Aux") input. This is a signal that has the color and luminance information combined into one signal. The picture will be a little less sharp, but still much better than using the "Channel 3" output.

>Where might I find one?

I've seen them a flea markets, garage sales, swap meets, ham fests, and in newsgroups like this one. Plus, many new TV's support S-Video and Composite video inputs.

>What are the advantages of using one of these rather than a TV?

Well, it's all a matter of how many stages the signal must go through.

1. The Atari generates video as a color signal and a brightness (luminance) signal. These are passed to the monitor port as Chroma and Luma signals (XL's have no Chroma output from the factory).

2. The signals are mixed together to make a standard video signal which is also passed to the monitor port as Composite Video.

3. Then the mixed video signal (along with audio) goes through the process of being "modulated" into a TV radio signal (channel 3 or 4). This step involves removing high frequencies from the video (blurring it) and sending it to the TV in a fragile broadcast form that's suseptable to all kinds of interference. Then the TV must (1) extract the video signal from the radio signal, (2) separate the Chroma and Luma components as best it can, then (3) divide the Chroma in R, G, and B. Any of these steps that you can eliminate will help your picture.

>Are there any other composite video monitors that anyone would recommend
>(and where might I find one)?

The most common one is probably the Commodore 1702 which has a very good picture and is quite reliable.

If you plan to use an XL (which I do), upgrading the video circuitry makes as big a difference as what monitor you choose. Ben Poehland has some excellent articles in Atari Classics magazines for improving the quality of the XL's video, as well as restoring the missing Chroma output."

Lonnie McClure has the last word on Commodore monitors:

Comodore models: 1701, 1702, 1802, CM-141, 1080, 2002, 1902, 1902A*, 1084**, 1084S**.

* The 1902A used a DIN connector for chroma/luma, which makes cabling a bit more of a problem. The composite and audio connectors are standard RCA jacks, however.

** The 1084 and 1084S had more than one version. Some used the a DIN connector for chroma/luma connections, like the 1902A, while some used standard RCA jacks.

The 1902 and 1902A are very different in appearance. The original 1902 shares the same slightly rounded front case design as the 1080 and 2002, while the 1902A is has a rather square case design, and was manufactured by Magnavox (as were some of the 1084 and 1084S versions).

Subject: 2.2) What is the difference between NTSC and PAL machines?

Software written for NTSC (North America) will always work on PAL machines, but software designed on PAL machines (Europe) won't necessarily work on NTSC machines.

Wayne Booth writes:

The differences with PAL and NTSC have to do with the number of lines displayed on the screen and whether they are using 50 or 60 Hertz.

If I remember correctly, I believe PAL has 625 lines/screen and they refresh the screen 50 times a second doing 1/2 the lines each refresh so they effectively repaint the screen 25 times a second. NTSC is 525 lines/screen with a 60 times a second refresh - again only half the lines each refresh so a 30 times a second frame rate. This would change the amount of time available during vertical sync pulse, and the number of lines that need to be redrawn each time.

Graham Thornton adds:

I use both a real PAL Atari 800 and a PAL-ANTIC 1200XL here in the US.

Replacing the ANTIC chip with a PAL version changes the screen refresh rate to 50Hz which allows most of the PAL-only European software to run. Your system will still report itself as a NTSC machine, unless you change the ROM (see the Nir Dary upgrade), but most software doesn't care.

But James Bradford responds: (7/19/00)
Not true. the PAL Flag is in the GTIA chip, not in ROM. The NTSC and
PAL roms are the same. Only Rev A ROM was had different versions. I am
not sure if Rev B ROMs had seperate versions.

Graham continues:
The one problem you might run into is your monitor. Replacing the ANTIC
will mean your North-American Atari is now generating an NTSC signal at
50Hz, instead of the usual 60Hz. Some people will tell you that modern TVs
and monitors don't care but that isn't actually true. My brand-new Sony
Trinitron 15" colour TV/monitor goes bezerk with the upgraded 1200XL, but
my 15-year old 10" Texas Instruments color monitor (designed for the
TI-99/4A) is fine.

You can also use real European equipment here in North America, provided
that you have a PAL-compatible TV/monitor. The frequency of the power
system is irrelevant, as I use my 800 with a 110V/60Hz 1050 power supply.

Subject: 2.3) Is the software for the Atari 8-bit computers "TV-standard
dependent?"

(some PAL demos flicker, or won't run at all on NTSC machines)

Brent Buescher, Jr. writes:

This is because PAL machines have a vertical refresh frequency of 50hz
(NTSC use 60hz) which translates into more vertical blanking time for
demos and other computation-intensive graphics software. So PAL demos
that won't work on NTSC machines are usually returning from a VBI
(vertical blanking interrupt) too late. Some also attempt to use more
vertical resolution ("longer" display lists) than an NTSC display can
handle.

Thomas Richter adds:

Yes, it is. Mostly because the frequency of the vertical blank interrupt
is different (60Hz for NTSC, 50Hz for PAL). The old OS A was not clever enough
to notice the difference, so all system timings like the keyboard auto-repeat
function depend on the TV system. These parts of the OS have been corrected
with OSB and the XL versions of the OS. However, as most games install a
VBI, their timing does still depend on the frequency -> they will run
slightly slower for PAL versions.

Another point is that the popular pseudo-colors used in the ANTIC-F
(Graphics 8) mode are not colorful at all when displayed on a PAL TV, because
of differences in the color encoding for the TV. The schematics of
the Xl computers include however a hack how to change the PAL version to
the NTSC version (the PAL versions include two crystals, one with 5/4th of
the frequency of the other. One is used for the system clock, the other for
the color clock), but I never dared to apply it.

Subject: 2.4) What are the PAL, NTSC and SECAM video broadcast standards?

Here are several links on the topic.

http://www.ee.washington.edu/conselec/CE/kuhn/ntsc/95x4.htm
http://www.alkenmrs.com/video/standards.html
http://www.ee.surrey.ac.uk/Contrib/WorldTV/
http://www3.3dresearch.com/video/Countries2.html
http://www3.3dresearch.com/video/Conversion2.html

Subject: 3.1) What are the Atari 410, 1010, and XC12 Program Recorders?

The Atari Program Recorders provide storage and retrieval of programs
and data on cassette tape. In addition to the digital track that stores
computer data, a second audio track is provided to play music or voice
as the program runs.

Data transmission rate: 600 bits per second.
Data storate capacity: 100,000 bytes per 60-minute cassette.
Track configuration: 4 track, 2 channel (digital data and audio track)

410 Program Recorder
- early Japan version had a carrying handle
- most versions made in Hong Kong
- 410a--Taiwan version
- permanent SIO cable - must end SIO daisy chain
- power - plugs directly into wall

1010 Program Recorder
- Chelco version has Stop/Eject, then Pause buttons
- Sanyo version has Pause, then Stop/Eject buttons
- two SIO ports

XC11 Program Recorder
XC12 Program Recorder
XCA12 Program Recorder -in same case as XC12...Poland
CA12 Program Recorder -in same case as XC12...Poland
image: http://romualdl.multimania.com/images/atari/ca12.jpg
XL12 Program Recorder -XC12 w/slight changed design. Czech/Slovak/Poland
XC13 Program Recorder -XC12 which was "T2000 ready". Czech/Slovak/Poland

---

Subject: 3.2) How do I run a program from cassette?

To run an Atari BASIC program from cassette:

1. Place the cassette in the recorder.
2. Press REWIND of FORWARD, if necessary, to bring the tape to the position
where the program is located.
3. Boot the computer to the Atari BASIC READY prompt.
4. There are several possibilities for the next step, depending on how the
program was saved, and whether you want to run the program or just load

it into RAM. Enter one of the following four commands:
a. CLOAD loads programs saved with CSAVE
b. LOAD "C:" loads programs saved with SAVE "C:"
c. ENTER "C:" loads programs saved with LIST "C:"
d. RUN "C:" loads&runs programs saved with SAVE "C:"

] Relative efficiency of the three cassette tape recording techniques:
] CSAVE/CLOAD - most efficient - fastest saves/loads - tokenized files
] SAVE "C:"/LOAD "C:" - middle efficiency - middle speed - tokenized files
] LIST "C:"/ENTER "C:" - least efficient - slowest - straight ATASCII

5. The computer will "beep" as a signal for you to press PLAY on the recorder.
6. Press the RETURN key on the computer keyboard, and the program will load
into the computer.
7. Press STOP on the recorder when loading has finished.
8. Unless you entered RUN "C:" above, now enter the command: RUN

To run an Atari BASIC or machine language program from cassette upon startup:

1. Place the cassette in the recorder
2. Press REWIND of FORWARD, if necessary, to bring the tape to the position
where the program is located.
3. Turn on the computer while holding down the START key.
But if your computer has Atari BASIC built-in and you're running a machine
language program, hold down both the START key and the OPTION key.
4. The computer will "beep" as a signal for you to press PLAY on the recorder.
5. Let go of the START/OPTION button(s).
6. Press the RETURN key on the computer keyboard, and the program will load
into the computer.
7. Press STOP on the recorder when loading is complete and the program is
running.

Subject: 3.3) What are the Atari 810, 1050, and XF551 Disk Drives?

==> Atari 810 --- a 5.25" floppy disk drive
The least common denominator for the Atari. Single-Sided, Single-Density:
FM 40 tracks x 18 sectors/track x 128 byte/sector = 90K capacity
19.2Kbps transfer rate. 288RPM.
The 810 includes a 6507 microprocessor.
Shipped with DOS I (very early) or DOS II Version 2.0S
earlier MPI version- push button door opening for disk access
later Tandon version- lift door, like a garage door disk access
two SIO ports
accessories from Atari:
CX8100 Atari 810 Blank Diskettes (5 per box)
CX8111 Atari 810 Formatted Diskettes II (5 per box)
CX8202 Atari 810/815 Blank Diskettes (5 per box, certified for double density)

Third-party upgrades for the 810:
810 Archiver -- copy many copy-protected programs
Happy 810 -- Happy Backup, Warp Speed 52Kbps, 18 sector buffer

810 Fast Chip by Binary 10%-40% faster
810 Turbo by Neanderthal Computer Things (NCT) -- double-density
see: http://www.qnet.com/~dons/810T.html

==> Atari 1050 --- a 5.25" floppy disk drive
Same as the 810, plus Dual-Density capability:
Single-Sided, Single-Density, 810 compatible
Single-Sided, Dual-Density, otherwise known as "Enhanced Density" because it
is not true double-density:
MFM 40 tracks x 26 sectors/track x 128 bytes/sector = 128K capacity
19.2Kbps transfer rate. 288RPM
The 1050 includes a 6507 microprocessor.
Shipped with DOS II v2.0S, DOS III, or DOS 2.5
DIP switches: Black & white left: Drive 1
Black right, white left: Drive 2
Black left, white right: Drive 3
Black & white right: Drive 4
Third-party upgrades for the 1050:
ICD US Doubler SS SD/ED/DD UltraSpeed (US) 54Kbps, sector skewing
Happy 1050 SS SD/ED/DD Warp Speed 52Kbps, 36 sector buffer,
Happy Backup. also read/write 180K 5.25" MS-DOS floppies
CSS Super Archiver SS SD/ED/DD UltraSpeed 54Kbps (US Doubler clone)
CSS Super Archiver II SS SD/ED/DD UltraSpeed 54Kbps (US Doubler clone)
Cheer-Up 1050 SS SD/ED/DD Warp Speed 52Kbps (Happy clone)
Speedy 1050 SS SD/ED/DD Warp Speed 55-57Kbps (Happy clone)
Super Speedy 1050 SS SD/ED/DD Warp Speed 55-57Kbps (Happy clone),w/180K RAM
SuperMax 1050 SS SD/ED/DD UltraSpeed 52Kbps (US Doubler clone)
Lazer 1050 SS SD/ED/DD Warp Speed and UltraSpeed 54Kbps

Rich Mier professes:
You've been plugging and unplugging the SIO cable with the 1050 power pack
plugged in, right? That's a no-no. Most of the time it's Okay, but about 1
in 10, 20 times, it will blow out 'U-1'. It's a CA/LM 3086 I.C. at the right,
rear of the main board. A 14 pin DIL chip. Actually it is an array of 5
transistors.

Unplug the power pack from the 1050, then unplug the SIO cable. Power can be
ON on the CPU. The problem has to do with the secondary winding of the Power
Pack. Remember, the problem only occurs 1 out of 10 - 20 times that you do
it, not all the time.

It doesn't really matter if the 1050 Transformer has power on or off, it
'Might' happen if plugged into the 1050. It is really bad on 810's.

One thing, if the system has been turned off for, oh say, 5 - 10 minutes it
won't matter. By then all the capacitors should be bled(sc?) to 0 volts.

==> Atari XF551 --- a 5.25" floppy disk drive
Single-Sided, Single-Density, 810 compatible
Single-Sided, Enhanced-Density, 1050 compatible
Single-Sided, Double-Density:
MFM 80 tracks x 18 sectors/track x 256 bytes/sector = 360K capacity

Writes "backwards" to the second side of the disk, rendering it incompatible
with existing third-party 180K formats on the reverse side of the disk.
High speed 38400 bps burst mode usable only with SpartaDOS X, SuperDOS
5.1, TurboDOS, DOS XE, and patched SpartaDOS 3.2.
Rotaton rate: 300RPM.
Shipped with DOS 2.5 or DOS XE.
DIP switches: Both dips down: Drive 1
Left down, right up: Drive 2
Left up, Right down: Drive 3
Left and Right up: Drive 4
Chinon-built XF551-cannot read/write/format backside if no timing hole
Mitsumi-built XF551--can read/write backside if to timing hole, if formatted
Third-party upgrades for the XF551:
CSS XF Single Drive Upgrade--3.5", 720K floppy drive replacement
also read 720K 3.5" MS-DOS disks
see http://www.nleaudio.com/css/products/XFsingdrup.htm
CSS XF Dual Drive Upgrade--add 3.5" drive w/o losing the 5.25" drive
also read 720K 3.5" MS-DOS disks
see http://www.nleaudio.com/css/products/XFdualdrup.htm
CSS XF551 Enhancer--overcomes sensor for index hole, create flippy disks
see http://www.nleaudio.com/css/products/XF551enh.htm
CSS XF Update--replace drive OS, adds UltraSpeed
see http://www.nleaudio.com/css/products/XFupdate.htm

Subject: 3.4) What floppy disk drives can I use with my Atari?

Major contributors to this section: Glenn M. Saunders, Tomasz M. Tatar,

Subject: 3.5) What kinds of 5.25" floppy disks can I use with my Atari drives?

Russ Gilbert writes:
If you're talking standard computer store, you can't use those 5 1/4" disks. I
mean you can't use high density disks. They must be double density to use
with the 1050. Almost all double density 5 1/4" disks have a hub ring, high
density disks don't have the hub ring.

RHamiIton5 elaborates: (5/12/01)
The Atari 8 drives do not have write heads and circuity which can handle the
type of oxide coating used on the high density floppy media; they cannot write
reliably to them. The hub ring has just become a sort of marker to distinguish
the high density from the standard double density diskettes.

Way back in your apple days of '79-'82, most disks were hubless and only the
really premium brands offered hubs to prevent slippage and out of round
problems; you could even buy little kits for adding you own hub rings.

When the home computer swell really hit around '83 and price wars began, hub
rings became common on good disks and eventually became standard down to
include most generic bargain diskettes.

The introduction of high density 5.25's required a different coercivity (=
magnetizability) to get more bits in a smaller space and suitable electronics
to do it. These disks were produced hubless; was it a differentiating label or
just unnecessary because of stronger mylar construction? Anyone?

Subject: 3.6) What do I need to connect a hard drive to my 8-bit Atari?

==> Corvus hard drive (10 megabytes)
Fast but still relatively slow I/O, kludge through joystick ports for 800 only

==> K-Products/Supra Hard Disk Drive Interface
by K-Products (Bob Klaas)
Some limitations on drive type and size and total number of drives in sys.

==> Multi I/O (MIO) (formerly from ICD)
from Fine Tooned Engineering (FTe) (Mike Hohman)
256 byter per sector restriction. 256K and 1 meg ramdisk models.
Printer and modem, modem will handle 19.2Kbps

==> CSS Black Box
RS-232 Serial Modem Port (19.2Kbps) w/ hardware flow control,
Parallel Printer Port,SASI/SCSI Hard Disk Port, Operating System Enhancements,
optional 64K printer buffer. Supports drives with 512-byte sectors.
see http://www.nleaudio.com/css/products/black.htm

==> IDE Hard Drive Interface
from Konrad M. Kokoszkiewicz and Jacek Zuk
(see http://www.orient.uw.edu.pl/~conradus/docs/ide_eng.html)
o Maximum drive capacity: 16777215 physical blocks on each device.
o Maximum number of partitions: 16
o Maximum capacity of a partition: 16777215 logical sectors
o Logical sector length: 256 or 512 bytes
o Average speed (in kilobytes per second, WDC 130AB drive):
- Native mode, sequence of sectors (R): 75
- Emulation mode, sequence of sectors (R): 43
- Emulation mode, back sequence (R): 28
- Emulation mode, random sectors (R): 13
- Emulation mode, same sector (R): 29
- Emulation mode, DOS file (W): 7
- Emulation mode, DOS file (R): 36
o Booting from any partition (on the standard XL OS)
o Write protection capability
o 8 jumpers to set the device number for the operating system
o Sweet 16 compatibility

==> Fine Tooned Engineering Multi I/O II
An IDE interface. Released?

==> MSC IDE Harddisk-Controller
created by Steve Birmanns and Matthias Belitz
http://www.birmanns.de/
* real device for the parallel-port of the Atari XL-Series
* up to 240 partitions per harddisk supported
* emulates D1: until D9: of disk devices (access to 9 partitions at one time)
* full bootable from any partition (with standard XL-OS)
* write protectition capability
* supports master/slave configuration
* more than 30 KB/s file access with SPARTA-DOS 3.2 gx (reading)
* more than 10 KB/s file access with SPARTA-DOS 3.2 gx (writing)
* access of ATAPI-CDROM with additional software

Subject: 4.1) What are the Atari 820, 822, and 825 Printers?

Atari 820 Printer:
- 40-column impact printer
- 5x7 dot matrix
- 40 characters per line, upper & lower case alpha
- horizontal and vertical alphanumeric characters
- 6507 microprocessor, 6532 RAM I/O chip, 2K ROM
- 40 characters per second
- uses Standard Roll Paper/adding machine paper

Atari 822 Thermal Printer:
- 37 characters per second
- 10 characters per inch
- 40 characters per line, upper/lower case and point graphics
- 5x7 dot matrix

Atari 825 80-Column Printer (= Centronics 737)
- 3 character sets:
monospaced 7x8 dot matrix at 10 characters per inch
monospaced condensed at 16.7 cpi
proportionately spaced Nx9 dot matrix at avg of 14 cpi (N=6..18)
- all characters can be elongated (printer double width)
- characters per line: 80 at 10 cpi; 132 at 16.7 cpi
- speed: 50 cps at 10 cpi; 83 cps at 16.7 cpi; 79 cps avg. proportional
- print buffer: 1200 dot columns
- paper: roll, fanfold, or cut sheets
- requires Atari 850 Interface Module or equivalent

Subject: 4.2) What are the Atari 1020, 1025, 1027, and 1029 Printers?

Atari 1020 Color Printer:
- 4-color graphics: (black, red, blue, green). optional 8-pen rainbow package
- alphanumberics and X,Y plotting capability
- 10 cps (40-column mode)
- 20, 40 and 80-column modes
- horizontal and vertical alphanumerics, English and International chr sets

- water soluble ink pen technology
- 4-pen barrel print head
- microprocessor
- paper: standard roll paper (40 column width)
- cassette software included

Frank McKenney writes: The printer/plotter mechanism for the Atari 1020 is (I believe) the same one used in the Tandy/Radio Shack CGP series and the Commodore 1520(?), and was made by a company named ALPS.

Atari 1025 80-Column Printer: (= Okidata ML80)
- 40 cps (80-column 10 cpi mode)
- 5 cpi expanded (40 col), 10 cpi (80 col), 16.7 cpi condensed (132-col)
- 5x7 character dot matrix
- buffer: 132 chrs at 16.7 cpi, 80 chrs at 10 cpi
- paper: roll,fanfold,single sheets. optional:roll paper holder, tractor feed

Atari 1027 Letter Quality Printer: (= Mann-Tally Riteman LQ.)
- fully formed characters, prestige elite 12)
- 12 characters per inch (80 columns)
- 20 characters per second
- single sheets or roll paper

1029 Programmable Printer (by Seikosha)
- 7-pin dot matrix, same as Commodore MPS-801
- Released for Europe only

Subject: 4.3) What are the Atari XMM801 and XDM121 Printers?

Atari XMM801 Printer:
- 80 columns, dot matrix
- friction feed or pin feed
- pica 10 cpi, double width pica 5 cpi, elite 12 cpi,double width elite 6 cpi, condensed 16.5 cpi, double width condensed 8.25 cpi
- Ribbon: Mannesman/Tally MS80

Atari XDM121 Printer:
- 80 column, daisy wheel--letter quality
- underlining, subscripts, superscripts
- friction feed paper
- Ribbon: Silver Reed CF130, Olivetti ET201,ET221,Nu-Kote NK136

Subject: 5.1) What are the Atari 830, 835, 1030, XM301, and SX212 Modems?

A MODulator/DEModulator translates digital information from your computer into acoustic tones that can be sent and received via standard telephone lines.

Atari 830 Acoustic Modem: (= Novation 'CAT')
- a stand-alone, acoustically coupled, frequency shift keying (FSK) modem
- up to 300 bits per second
- Bell 103/113 modem compatible

- requires Atari 850 Interface Module or equivalent

Atari 835 Direct Connect Modem:
- 300 bps
- Bell 103/113 modem compatible

Atari 1030 Direct Connect Modem:
- 300 bps
- Bell 103/113 modem compatible
- built-in ModemLink software.
- 2 SIO ports

Atari XM301 Modem:
- direct-connect
- 300 bps
- Bell 103/113 modem compatible
- with XE Term disk software
- permanent SIO cable
- draws its power from the computer via SIO

Atari SX212 Modem:
- SIO & DB25 RS232 serial ports.
- 1200 baud
- Bell 103/113/212A modem compatible
- rarely with SX-Express! disk software.

Subject: 5.2) What should I know about modems and the Atari?

Thanks to Bob Puff and Clay Halliwell for helping me with this section.
But I'm still not real confident about the accuracy here. I'd love for
anyone to help me fix up this section!

There are three types of modem protocols: modulation protocols, error
correction protocols, and compression protocols. The international
standards for these protocols are laid down by the branch of the United
Nations known as the ITU-TSS (formerly the CCITT). ITU standards are
known by their "V-Dot" names. They're only names, don't try to apply
any meaning to the names.

Modulation protocol standards, the major ones
(bits per second)
300 bps - V.21 (103J is used instead in the USA)
1200 bps - V.22 (212A is used instead in the USA)
2400 bps - V.22bis
9600 bps - V.32
14.4 Kbps - V.32bis
28.8 Kbps - V.34

Error Correction standard:
V.42 - requires either software or hardware flow control

Compression standard:
V.42bis - requires V.42, and hardware flow control.

If your modem is capable of V.42bis compression, set your communications software to enable hardware flow control. If your terminal interface allows you to set the terminal<->modem (DTE) and modem<->modem (DCE) baud rates separately, you should set the DTE rate to the maximum allowed. If the DTE and DCE cannot be set separately, set the terminal baud rate at four times the maximum actual data rate of your modem (V.42bis achieves a compression ratio of up to 4:1). Examples: If a V.22bis/V.42bis modem is used, set the terminal for 9600 baud. If a V.32/V.42bis modem is used, set the terminal for 38400 baud. If a V.32bis/V.42bis modem is used, set the terminal for 57600 baud.

Let's define a "high-speed" modem as a modem capable of V.42bis compression. (Some 2400 bps modems, and all modems faster than that)

Using high-speed modems on the Atari

Unless you're using a CSS Black Box or a patched MIO, the 8-bit Atari RS232 interfaces do not support hardware flow control. (I have heard that the P:R: Connection does too, but it can't be controlled in software.) So we must send the modem a command to tell the modem not to use it. Using a Hayes-compatible modem, the modem command AT &K4 will enable software flow control, and disable hardware flow control. AT &K0 will disable all flow control.

The MIO patch, HyperSpeed by Len Spencer, is available at:
http://members.aol.com/lenspencer/atari8.htm

Question. Why does my modem report V.42bis is used even when my terminal it set for the same speed as my modem?

Cause the modem will do what you tell it. You've configged it to talk at the highest speed, using LAP/M, and compression. Even if you connect modem to modem at 14.4k, you can be talking to the modem at 300 baud, and it will still use everything. You'll undoubtedly drop bytes, but hey...

Question. Why does V.42bis compression appear to function after I have sent the modem the AT &K4 or AT &K0 commands? And knowing the Atari doesn't support hardware flow control?

Compression doesn't have to have flow control to work. Same as above - its just an added step that the data goes through. Note that if the modem's input buffer is small, you can overrun it easily if you send it data faster than it can digest and send. That's why you -really should- be using flow control with compression... But it's not a necessity.

Question. Why does V.42 error correction appear to work even when I have disabled flow control with the AT &K0 command?

Question. Why don't I have problems performing binary downloads when I have software flow control enabled? (flow control characters could appear in data stream accidentally)

Depends on the protocol. Zmodem accounts for spurious XON/XOFFs. Xmodem and Ymodem don't. Also, you are able to digest the data as fast as the modem is giving it to you, hence no flow control is happening. I suspect it would be a different case if you were uploading using a streaming protocol like Ymodem G.

More tips, from Clay Halliwell:
On 11 Feb 1996, Marc G. Frank said:

> I'm having problems getting a modem attached to my Atari 850 to
> communicate at 9600 baud. When I set my communications program to 2400
> baud, everything works fine. However, when I set it to 9600 baud, the
> modem echoes my characters but doesn't act on them. That is, at 2400,

The problem with the 850 is that some of them (like mine) don't produce a PERFECT 9600 baud signal. As a result modems can't train on it, and while they will echo characters back, for some nitpicky reason they won't pick up on the "AT" attention code.

The solution is to do all your dialing at 2400 baud, but set the S37 register to force the modem to try to connect at 9600. Then switch your Atari to 9600 after connecting.

Jon Melbo responded to me in 1997:

>I have a Zoom 2400bps V.42bis modem, connected through a P:R:Connection. I
>need to do the
>at&k4 no matter what I'm dialing into, and no matter what comm program I'm
>running.
>
>Nobody's ever really been able to explain it to me, but I know it has helped a
>few other people. Try it!

What &K4 does is select XON/XOFF flow control. Apparently, all/most atari serial interfaces or at least R: handler software does not support hardware (CTS/RTS) handshaking (selected on the modem via &K3 which is also a default). Anyway, that's why the &K4 setting helps a lot.

Glenn Saunders responded to other writing of Jon's, 4/5/97:
: 28.8 CARRIER connects are possible BB or no, it's just that there is
: no point in having your modem do data faster than your puter can.

It simplifies modem configuration to let the modems connect at their native speeds.

: Right! But you should never have your DCE to DCE speed exceed your
: DTE to DCE speed. Never, unless you like errors and strange behavior.
: With a BB, one should use CTS/RTS flow control, and force the modem to
: operate at a maximum of 19.2 PERIOD (this means disable compression).

It doesn't really matter. CTS/RTS can throttle the I/O down as much as it needs to. The faster modem will wait for I/O without any complaints. Disabling compression isn't a good idea because it will disable it for ALL calls including 9600 or 14.4 users in which it could do some good even on an 8-bit BBS. Software flow control is pretty much dead in

telecommunication, and has been dead as long as data compression has been standard since the stop and start commands take way too long to register that way.

: If using some other serial interface, I would use software flow
: control, disable data compression on the modem, force the modem to a
: max speed of 9600bps, and experiment with error correction. Does

This combination is deadly for most modern users unless they degrade their modem via reconfiguration. And if users have to do this, odds are they will stay away rather than futz with AT settings to get a reliable connect. That's why I think the MIO essentially died as a viable BBS interface when 14.4s became standard. They won't work well unless the "mythical" hardware flow control of the thing is enabled in some way.

An explanation of XON/XOFF from Eric Sokolowsky, 4/11/97:

I looked in my modem manual, and the at&k4 command enables XON/XOFF flow control, which is a form of software flow control. As I understand it, when a XOFF is sent by the receiving end of a line, the sending end holds off sending for a little while to give the receiving end a chance to catch up. When the receiving end catches up, it can send a XON which tells the sending end to continue sending. Using this should reduce the liklihood of dropped characters. It's not as good as hardware (RTS/CTS -- check out the FC light on most high-speed external modems on fast transfers) flow control (enabled by default or the at&k3 command), but it's good enough for the Atari, which as I understand, doesn't normally allow hardware flow control, unless using such a device as the Black Box.

to which Robert Ely responded:

Just a quick addition. If you are using a modem at 9600bps or faster, don't use xon/xoff, use the RTS/CTS. Since you can do this with the MI/O and BlackBox, use it for all it's worth. If you are on an 850 or P:R:Connection, you won't be able to deal with it and probably won't be going at or above 9600bps anyway.

Subject: 6.1) What is the Atari 850 Interface Module?

Atari 850 Interface Module:
- early design all metal (black) case
- most in plastic beige case
- four 9-pin serial EIA RS232C ports
- One 15-pin 8-bit parallel Centronics-type port
- programmable baud rate on any port, including:
75, 110, 134.5, 150, 300, 600, 1200, 1800, 2400, 4800, and 9600 bps;
baudot speeds of 60, 66, 75, 100 words per minute
- uses standard ASCII. Baudot support for radio-teletype (RTTY).

Subject: 6.2) What is the Atari XEP80 Interface Module?

This text written by Thomas Raukamp.

Since the development of the Atari 8-bit line of computers in 1979, users wanted better text displays than the default 40x24. There has been some attempts to satisfy this need, like the Austin-Franklin board or the Ace 80/80xl cartridge. For more informations about these modifications read The Atari 8-bit Hardware Upgrade FAQ from David A. Paterson.

The Atari XEP80 Interface Module is Atari's entry to the 80 column field. It lets a XL, XE, 400 or 800 computer system display a full 80 columns across your monitor screen. The XEP80 provides a 256-character wide by 25-line display window. Up to 80 characters are displayed horizontally at once, and you can scroll horizontally all the way to the 256th character, depending on the application you're running. The XEP80 is connected to your system via a joystick port.

The XEP80 Module interprets commands from the computer for screen display or output to a printer. The module is supplied with an industry-standard 8-bit parallel port so you can connect a parallel printer to your Atari 8-bit (I even use a HP LaserJet IV on my 130XE ;)).

All programs that use the standard screen call (E:) should be compatible with the XEP80 Module. The software provided by Atari supports a 320x200 graphics mode - this mode only support direct bit images. Note that you can't use all of the standard graphic capabilities of the Atari anymore.

Although Atari recommends a monochrome monitor for usage with the XEP80, it runs fine with any type of composite monitor. The output looks great on my Commodore 1084 for example.

Along with the module comes a software-package containing an AUTORUN.SYS file, which is the XEP80 handler. If you want to use the module with an application that is compatible with the XEP80, which has it's own AUTORUN.SYS file, you can append the application's AUTORUN.SYS on the module's AUTORUN.SYS.

Subject: 6.3) What accessories did Atari produce for their 8-bit computers?

This should be a complete list of Atari "CX" accessories, two or three digit numbers, marketed for use with the 8-bit computers.

CX30-04 Paddle Controller Pair
CX40-04 Joystick Controller Pair
CX40 Single Joystick Controller
CX41 Joystick Repair Kit
CX22 Trak-Ball
CX23 Kid's Controller
CX24 Pro-Line Joystick
CX42 Remote Control Wireless Joysticks
CX50 Keyboard Controller Pair
CX70 Light Pen (beige; the original Atari light pen)
CX75 Light Pen (+ Atarigraphics cartridge)
CX77 Touch Tablet (+ AtariArtist cartridge)
CX78 Joypad (shipped with the 7800 in Europe)
CX80 Trak-Ball
CX81 I/O Data Cord (5 ft)
CX82 Monitor Cable (Black and White Monitor)
CX85 Numerical Keypad (+ software Handler on diskette)
CX86 Printer Cable (included with 825 Printer)
CX87 Interface/Modem Cable (included with 830 Acoustic Modem)
CX88 Interface/Terminal Cable (null modem)
CX89 Monitor Cable (Color Monitor)
CX418 The Home Manager Kit (Personal Financial Management, Home Filing Manager -or- Family Finances, The Home Filing Manager)
CX419 The Bookkeeper Kit/Atari Accountant (The Bookkeeper disk, CX85 keypad)
CX481 The Entertainer (Star Raiders, (Missile Command or Pac-Man), 2 joysticks)
CX482 The Educator (410, BASIC cart., States & Capitals cassette)
CX483 The Programmer (BASIC, BASIC Ref. Manual, BASIC Self-Teaching Guide)
CX484 The Communicator (850, 830, TeleLink I cart.)
CX488 The Communicator II (835, TeleLink II cart.)
????? The Arcade Champ (Pac-Man, Qix, 2 joysticks, cartridge storage case)
????? The BASIC Tutor I (Inside Atari BASIC book,Invitation to Programming 2&3)
CX852 8K RAM Memory Module (for 800 computer)
CX853 16K RAM Memory Module (for 800 computer)

Subject: 6.4) What "vaporware" computers/peripherals were never released?

For definitive information on unreleased Atari products, see:

Atari Historical Society, http://www.atari-history.com/ (Curt Vendel)

Atari 8-bit vaporware computers: (note some are more vaporous than others)
800D (Developers Bus System)
1000 Sweet 16 Project, lower end model. Became the 1200XL
1000-X Sweet 16 Project, higher end model. Became the 1200XL
1200 1200XL internally, many slight cosmetic differences
1200XLS 1200XL Show prototype, top-mounted cartridge slot
600 early 600XL, all black case, joyports on the left, missing PBI
800XL brown prototype
800XLD low-cost 1450XLD,no modem&speech,include disk drive controller&FREDDIE
900XLF early name for 65XE
1250XLD Earlier name for the 1450XLD
1400XL brown prototype
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XL 1400XL plus room for 2 internal 5.25" drives (controller not included)
1450XLD 1400XL plus 5.25" floppy drive (Epson SD521 360K disk drives)
1600XL Amiga/Amiga-like.Now appears that 1850XLD was the model name for this
1650XLD to use 1450XLD case and 1200XL keyboard
1850XLD "Mickey" Atari clone of the Amiga Lorraine
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMY sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 Dual Disk Drive -2 x SS/DD 180K with DOS 2.0D. some were produced!
1027 PLUS -daisy-wheel, 80 columns
1053 -looks like a 1050, but supports DS/DD 360K format
1055 -a 1050 (SS/ED) with a 3.5" mechanism
1060 CP/M Add-On Module -"SweetPea" Z-80 CPU, 64K RAM, CP/M 2.2, 80 col display
1090 XL Expansion System-5 PBI slots, CP/M/MS-DOS/Apple II compatible
XM128 -12" green monitor w/ built-in 80-column card
XC1411 -composite 14" color monitor (Goldstar)
XF521 -5.25" floppy drive - 1050 compatible, in XE style
XF351 -a 3.5" drive.
XC35 -an XF551 with a 3.5" mechanism
XTM201 -non-impact printer
XTC201 -XE Thermal Color Printer

Subject: 6.5) What are the power requirements for my Atari components?

Thanks to Matthias Belitz for the European
data in this section. I need more international help!

As with the rest of this FAQ list, please let me know if any of this
information conflicts with the units you have.

The most important information is the voltage (in volts) required, and
whether you need a transformer (AC output) or an adapter (DC output).

The power (in voltamps or watts) and current (in amperes) specifications
of the original equipment as presented here should be regarded as
minimum values. Higher-than-specified power and current capacities are
entirely usable, and often preferable because such supplies run cooler
and last longer.

Direct Current (DC):
Power (in watts) = current (in amps) * voltage (in volts)

Alternating Current (AC):
Apparent Power (in voltamps) = current (in amps) * voltage (in volts)
Effective/True Power (in watts) = current (in amps) * voltage (in volts)
* (cosine of the angle of lag)

N O R T H A M E R I C A: INPUT = 115-120 V AC, 50/60Hz
==========
9 V AC 5.4 VA (600 mA) Atari#CO62195/CO17539 transformer:

2	XL/XE	05/10/1983	0x1f9cd270	CO61598B
3	800XE	03/01/1985	0x29f133f7	C300717
4	XEGS	05/07/1987	0x1eaf4002	C101687

(?) This information is missing. If someone can supply this info,
please write me an e-mail.

NOTES:
The 400/800 O.S's consist of three ROMs (two 4kB and one 2kB).
The 1200XL contains two ROMs for the OS (8k each), XL/XE's use a single
16k ROM and the 16k XEGS OS is stored in a 32k ROM (together with 8k
BASIC and 8k for Missile Command).

Origins of ROM information
~~~~~~~~~~~~~~~~~~~~~~~~~~
400/800 rev.A NTSC Could exist, since the PAL version exists and
rev.A is mentioned in the rev.B source code.
400/800 rev.A PAL All info found in two Atari 400's and Atari 800
ROM module CX801.P
400/800 rev.B NTSC Information from a ROM dump and the rev.B source
listing. The part numbers were listed in the
catalog from 'Best Electronics'. According to
'Mapping the Atari' rev.B ROMs have a 'B' at the
end of the part number, therefore I figure these
part numbers are from rev.B.
400/800 rev.B PAL Could exist, since the NTSC version exists and
there's some conditional PAL/NTSC assembly in
the rev.B source code
1200XL rev.10 PAL/NTSC All info found in an Atari 1200XL. The XL/XE
rev.2 source code refers to it as rev.10.
'Best Electronics' calls it rev.A.
1200XL rev.11 PAL/NTSC Refered to rev.11 by the XL/XE source code.
'Best Electronics' calls it rev.B.
XL/XE rev.1 All info found in an Atari 600XL
XL/XE rev.2 All info found in an Atari 800XL
XL/XE rev.3 All info found in an 800XE
XL/XE rev.4 All info found in an Atari XE Game System

O.S. Authors and dates
~~~~~~~~~~~~~~~~~~~~~~
The following info is from the Atari XL/XE rev.2 source code.
~~~~~~~~~~~~~~~~~~~~~~

Revision A (400/800)
D.Crane / A.Miller / L.Kaplan / R.Whitehead

Revision B (400/800)
Fix several problems.
M.Mahar / R.S.Scheiman

Revision 10 (1200XL)
Support 1200XL, add new features.
H.Stewart / L.Winner / R.S.Scheiman /
Y.M.Chen / M.W.Colburn 10/26/82

Revision 11 (1200XL)
Fix several problems.
R.S.Scheiman 12/23/82

Revision 1 (600XL/800XL)
Support PBI and on-board BASIC.
R.S.Scheiman / R.K.Nordin / Y.M.Chen 03/11/83

Revision 2 (600XL/800XL)
Fix several problems.
R.S.Scheiman 05/10/83
Bring closer to coding standard (object unchanged)
R.K.Nordin 11/01/83

Vapour-ware
~~~~~~~~~~~
The following OS roms originate from rare Atari 8-bit systems.
Since I don't own any of these (unfortunately), I don't have much
information about these roms. Who can help me?

I've got two 16K rom dumps from the 1450XLD. Both ID's are rev.3.
The first dated 3/23/1984 comes from the 'Pooldisk Too' CD-ROM
(filename: 1540os3.v0) and the second dated 6/21/1984 was send to
me by Nir Dary (filename: os1450.128). Main differences between
these two are in the first 3K ($C000 - $CBFF).

The XL/XE OS rev.3B is from an Atari from Arabia. It's probably based
on rev.3. There are changes in the fonts (Arab characters) and several
patches in the code. More info at:
http://www.savetz.com/vintagecomputers/arabic65xe/

Rev.	Found in	Size	CRC-32	Date
3	1450XLD	16kB	0x0d477aa1	3/23/1984
3	1450XLD	16kB	0xd425a9cf	6/21/1984
3B	65XE	16kB	0xf0a236d3	7/21/1984

~~~~~~~
Special thanks to Nir Dary for the rev.2 source code, rom dumps and the 1200XL. It's in good hands.

~~~~~~
More info on what is maybe either the 1985 or 1987 XL/XE OS versions listed above. From ST*ZMAGAZINE #36, Sept. 1, 1989 (as reprinted in PSAN Nov 89):
by Mark Elliot, Innovative Concepts
The following changes have been incorporated in the 130XE computer.

The O.S. has minor changes like:
A) The MEMORY TEST (from SELF TESTS) tests the extra 64K now! (in 4 squares)
B) Also, the MEMORY TEST checks the first 48K over TWICE as fast as before!
C) The KEYBOARD TEST has the F1-F4 keys missing on top. (function keys), although the code that interprets them is probably there (like XEGS).
D) Also, it types out "COPYRIGHT 1985 ATARI" at the keyboard test, when all tests are done. (compared to COPYRIGHT 1983 ATARI, before)
E) And, the O.S. chip itself, is on a 27256 EPROM, but only half of it is used! (comprared to the original, which was on a 16K x 8 ROM, 27128 comp.
~~~~~~
james adds (3/8/01):
Your faq, regarding OS Rev A, states:
Origins of ROM information
~~~~~~~~~~~~~~~~~~~~~~~~~
400/800 rev.A NTSC Could exist, since the PAL version exists and rev.A is mentioned in the rev.B source code.

Did exist! My parents bought me an Atari 400 w/ 410 back in 1981 for entertainment when I was badly injured in a motorcycle accident. A year or so later I paid good money ($40 USD or so?) to have the OS A upgraded to OS B.

Subject: 7.2) What versions of Atari BASIC are there?

There were three versions of Atari BASIC produced: A, B, and C.

At the READY prompt, enter "? PEEK(43234)"

If the result is: You have Revision:
162 A
96 B
234 C

Freddy Offenga adds:
You can also take a look at the part numbers on the IC's
inside your Atari and compare them with the numbers from
the following table:

Part# Version
~~~~~~~~~~~~~~~~~~~~ ~~~~~~~~
CO12402 + CO14502 A
CO60302A B
CO24947A C

On versions A, B, and C, Greg Miller writes:

"Rev A had a number of bugs, not just the commonly
described crash bug. Rev B fixed most (maybe all, I don't remember) of
these, but in the process, they added a new bug. You see, the crashes
were caused by a bug in one of OSS's memory move routines. When the bug
was fixed, the fix mistakenly applied to a routine that actually worked
in Rev A, causing the new lockup problem.

Rev C differs in only a few bytes. AFAIK, the only change was to remove
the alteration made to the routine that was broken by Rev B.

You can get more details from the annotated source listing published by
Compute! books. Bill Wilkinson described many of the problems in detail.
He also talked about it in his column in Compute! magazine."

Wally Lang adds:

--- Warner's Atari issued Rev B in two formats:
(1) As a built-in Basic on 600XL and 800XL computers.
(2) As a special request order item for 400/800 and 1200XL computers.

--- Tramiel's Atari issued Rev C in both formats for XE series computers and
ALL previous Atari 8-Bit Computers.

Subject: 7.3) What are Atari DOS I, DOS II v2.0S, DOS III, DOS 2.5, and DOS XE?

Here are short descriptions of the various Disk Operating Systems (DOS)
versions produced by Atari for use with their 8-bit computers.

The original Atari DOS shipped with all 810 disk drives from 1979-1981. It
consists of a single file, DOS.SYS, which is loaded into memory from disk on
startup.
At the top of the menu screen it reads:
DISK OPERATING SYSTEM 9/24/79
COPYRIGHT 1979 ATARI
Unless you are a collector, you probably have no reason to work with DOS I.
The DOS I disk is labeled: Atari 810 Master Diskette (CX8101).

DOS II Version 2.0S was shipped with all 810 disk drives, and early 1050 disk
drives, from 1981-1983. It consists of two files:
DOS.SYS is loaded into memory from disk on startup
~~~~~~~~~~~~~~~~~~~~

DUP.SYS, which contains the DOS menu, is loaded only when needed.
MEM.SAV can be employed to preserve the contents of memory to disk when
DUP.SYS is loaded, so that the data can be restored to memory when exiting
from the DOS menu. DOS 2.0S supports Atari's proprietary single-sided, single
density 90K 5.25" floppy disk format only. DOS 2.0S represents the lowest
common denominator of Atari DOS versions--you can be assured than any Atari
disk drive for the 8-bit Atari can work with disks formatted with DOS 2.0S.
The DOS 2.0S disk is labeled: Atari 810 Master Diskette II (CX8104).

DOS II Version 2.0D was shipped with the rare Atari 815 Dual Disk Drive.
This is the double density version of DOS 2.0S.
The DOS 2.0D disk is labeled: Atari 815 Master Diskette (CX8201).

DOS III shipped with 1050 disk drives from 1983-1985. It was created in part
to take advantage of the 1050's Dual-Density capability, by employing a
single-sided, enhanced-density 128K 5.25" floppy disk drive format. Atari
called this format "dual-density," but the Atari community quickly came to
refer to this format as "enhanced-density" to better differentiate it from
widely available 3rd-party truly double density disk drives and supporting
versions of DOS. DOS III uses a disk format incompatible with DOS 2.0S. It
included a utility to convert files from DOS 2.0S to DOS III, but not back
again. It used disk space less efficiently than DOS 2.0S. For these reasons
and others, DOS III was not widely accepted by the Atari community, and like
DOS I is not generally used except for curiosity's sake.

DOS 2.5 shipped with 1050 disk drives and early XF551 disk drives from 1985-
1988. DOS 2.5 represented Atari's relenting to the masses, returning to DOS
2.0S compatability. DOS 2.5 very closely resembles DOS 2.0S, with just a
few features added. It supports both DOS 2.0S single-density 90K formats, as
well as an enhanced density 128K format for use with the 1050 disk drive.
DOS 2.5 also includes a RAMdisk utility for use with the 128K 130XE computer,
a utility to convert files from DOS III disks back to DOS 2.5, and other disk
utilities. DOS 2.5 is just about as universal among Atari users as DOS 2.0S.

DOS XE shipped with XF551 disk drives from 1988-1992. Like DOS III, DOS XE
introduced a whole new format for Atari floppy disks; but unlike DOS III, DOS
XE also preserved general compatability with DOS 2.0S/2.5. DOS XE supports
the full capabilities of the double-sided, double density 360K per 5.25"
floppy disk XF551 disk drive, including that drive's high-speed burst mode.
DOS XE also fully supports the 90K SS/SD capability of the 810 disk drive, the
128K SS/ED capability of the 1050 disk drive, the 180K SS/DD capability of
most 3rd-party disk drives for the Atari, and a RAMdisk for use with the
130XE. Date-stamping of files is supported. DOS XE requires an XL or XE
computer; it is not compatable with the 400/800 computer models. Even though
DOS XE was critically well-received, and represented a substantial jump in
capabilities over DOS 2.5, its arrival came so late in the crouded realm of
Atari and 3rd-party DOS versions that it never achieved much acceptance among
real users, and is now relegated to the same status as DOS I and DOS III before
it. Before its release, DOS XE was widely known as "ADOS."

Subject: 7.4) What's the best DOS for the Atari?

This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system.

Either MYDOS or SpartaDOS will work with almost any disk drive, up to 8 drives or hard disk partitions, and ramdisk.

MYDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support. MYDOS 4.53 is freeware from Wordmark Systems (Charles Marslett and Bob Puff). There are two versions of MYDOS 4.53, one uses 3 digit sector numbers where possible, known as 4.53/3; the other, known as 4.53/4, uses 4 digits minimum. Complete documentation about the disk formats and commands, as well as the source code, is available. MyDOS 4.53/3 was released by David R. Eichel on 12/31/89.

SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2g and 3.2gx are disk-based; SpartaDOS X 4.22 is cartridge-based and includes many additional features. SpartaDOS 3.3a and 3.3b were rewritten by Stephen J. Carden for use with BBS Express PRO!. SpartaDOS 3.3c is produced on a 16K ROM cartridge from Video 61.

It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. DOS 2.5, MYDOS and SpartaDOS are all available on the archives.
filenames: Os/dos25.arc (DOS 2.5)
Fte/fte32g.arc (SpartaDOS 3.2g)
Os/mydos453.dcm (MYDOS - latest version)
Os/mydos45m.arc (MYDOS - latest complete doc's)

Another popular, powerful DOS is BW-DOS, freeware by Jiri Bernasek.
(it is pronounced "Bay Vay Dos")

Carolyn Hoglin adds:
I didn't see TOP-DOS mentioned anywhere. This superior DOS was written by R. K. Bennett of Eclipse Software in Sunnyvale, CA. It was based on Atari DOS, but with many, many more features. It fully supports my double-density, double-sided Astra drives, automatically sensing the proper density and sidedness of both drives 1 and 2. (MYDOS only seemed to do that on drive 1.) Also supported are large ramdisks for Axlon, Mosaic, etc. The latest version was TOP-DOS 1.5+, which came with an excellent manual explaining how to use its powerful capabilities.

Any other versions of DOS all 8-bit Atari users should be aware of??
- SuperDOS 5.1
- BiboDOS 5.x

Subject: 7.5) How do I modify Atari DOS to support more than two drives?

Russ Gilbert writes:

DOS 2 type DOSes default to two drives.
Boot DOS and BASIC.
? PEEK(1802)
if it is 3 then you only recognize two drives.
To get the 3rd drive, poke 1802,7. Then go to dup.sys (type DOS)
and write system files. Next time you boot that DOS, you'll recognize
3 drives.
If you want four drives, poke 1802,15.

Subject: 7.6) Are there Graphical User Interfaces (GUIs) for the Atari?

Contributors: Andreas Magenheimer (5/12/01), Mathy van Nisselroy (5/12/01)

- Diamond GOS version 1 (PD disk version), version 2 (cart), version 3 (cart); plus some applications (painter program, text program, etc.); Diamond GOS has been made freeware by the author Alan Reeve;

- G.O.S., the Graphic operating system by Total Control systems; two different versions are avaiable (I call them GOS 1 and GOS 2) and they are PD;

- G.O.E., the Graphic Operating Environment also by Total Control Systems (this one merely works under Sparta DOS, not with Bewe-DOS and not at all with DOS 2.x); so far I have found 3 different versions (GOE 1,2,3) with some applications (graphic/painting program, etc.); PD;

- S.A.M., the Screen Aided Management (unfortunately it has the same name as SAM, the software aided mouth) from PPP/Germany. It is avaiable in two different versions: a) the type-in listing from Atari magazin and/or the Lazy finger disks (which are PD!) or b) the commercial version 2.0 which has many add-ons and can still be bought from Dean Garaghty/UK or PD-World-Versand/Germany; This GUI merely works correct under DOS 2.5 and Medium/dual density, however...

- BOSS-XL, the XL-Desktop from Mirko Sobe; written in Turbo-Basic; freeware; http://www.atarixle.de/

- BOSS-XE, the XE-Desktop from Mirko Sobe; written in Turbo-Basic;freeware, http://www.atarixle.de/

- BOSS-X the newest desktop version from Mirko Sobe, needs an 128k+ Computer (128k or more memory), supports MyDOS up to 16MB and MyDOS subdirs...; still written in Turbo-Basic; many applications and drivers; freeware; http://www.atarixle.de/

- XL-TOS a small and "cheap" GUI version from Atari magazin (i.e. a type-in listing; the basic file, which consists of many data lines creates a short object code file); unfortunately this GUI only looks good, it loads almost nothing... PD;

- ST-TOS a small basic program, that looks like a GUI; it can merely load Basic files and do a few DOS commands, like lock, unlock, delete and such... (PD)

- Basic desktop, a GUI written in Basic just as a sample, what can be done with an 8-bit computer; this one loads basic and text files (maybe also ML files); PD;

- DCS, the desktop construction set from Tom Hunt; there are 3 different versions avaiable, a) for DOS 2.5, b) for MyDOS andc) for Sparta-DOS; I have tested the Sparta DOS version, which worked with batchfiles and could easily load some ML files, text files and basic files (which were already on the DCS disk); it also works with high densities and/or hard disk partitions up to 16MB and supports subdirs of course; hmm, freeware or shareware ?!?

- ATOS - GUI by Tom Hunt, it's being Beta tested

- there are a lot more GUI programs, however many of them are written in Basic or Turbo Basic and are very restricted; most of them merely look like a GUI but need to much memory for everyday use. Thats why most users still prefer those DOS or Gamedos (Gameloader, Multiloader, etc.) programs...

Subject: 8.1) What are the best terminal emulators available?

Here are some of the more popular PD/freeware/shareware terminal programs available.

Ice-T XE v2.72 (128K XL/XE) or Ice-T 800 v1.1 (48K)
shareware by Itay Chamiel
Emulates: VT100
Text: 80 column via a fast-scrolling graphics 8 screen
File Xfer: X/Y/ZMODEM download
Autodial: Yes (2.72) or No (1.1)
Backscroll buffer: Yes--8 screens (2.72) or One screen (1.1)
Capture-to-disk: Yes--up to 16K (2.72) or No (1.1)
Summary: Outstanding flicker-free high-speed VT100 emulation.Recommended!
http://www.cs.huji.ac.il/~itayc

FlickerTerm 80 v.0.51, freeware by LonerSoft (Clay Halliwell)
Emulates: VT100, IBM ANSI
Text: 80 column via a special Graphics 0 screen (no hardware req'd)
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Fastest and most complete VT100 emulation; readability a minus

BobTerm 1.22, shareware by Bob Puff
(There's also a 1.23 that's specific to PC XFormer)
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Feature-filled; best for BBSing

filename: Telecomm/bterm12.arc

Kermit-65 3.7, PD by John R. Dunning
Emulates: VT100
Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)
File Xfer: Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Excellent VT100 emulation; rock-solid Kermit Xfers
filenames: Telecomm/k65v37.arc - latest version
Telecomm/k65doc.arc - documentation
Telecomm/k65src.arc - source code

OmniCom by CDY Consulting
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Only option combining VT100, XMODEM, Kermit; buggy at file Xfers
filename: Telecomm/omnicom.arc

VT850 B1, shareware by Curtis Laser
Emulates: VT100/VT102 (plus complete VT220 keymap)
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Only option for VT100 emulation on the XEP80; 1200bps top speed
filename: Telecomm/vt850b1.arc

Subject: 8.2) What BBS software can be used on the Atari?

This section mostly by Winston Smith.
Credit for AMIS to MACE by Steven Sturza.

o A.M.I.S. BBS -- The A.C.E. Message Information Service.
The AMIS BBS was written in BASIC by people from the
Michigan Atari Computer Enthusiasts. It included designs for a ring-detector.
You needed a sector editor and had to allocate message space by hand, hex byte
by hex byte.

Steven Sturza adds:
The AMIS BBS was written by people from the Michigan Atari Computer
Enthusiasts.

o FoReM BBS -- Friends of Rickey Moose BBS.
At the time, there were a lot of BBSes around

called things such as "FORUM-80" and "BULLET-80", ergo the name. FoReM BBS was the first truly RBBS-like BBS for the ATARI 8-bit. It was programmed in BASIC and was somewhat crashy. I think that this is the great-grandparent of the FOREM-XE BBSes that survive today.

Matt Singer writes:
FoReM BBS derived from an early AMIS. When multiple message areas were added the name was extended to FoReM 26M. Then, When OSS released BASIC XL the program was rehacked and called FoReM XL... Bill Dorsey wrote most of the Assembler routines (where is he now?).

o ABBCS -- The ANTIC Bulletin Board Construction Set.
The user design of the ABBCS was very good. It sported features such as intra-line editors. Unfortunately, the coding of the ABBCS was really poor. You could practically blow on your keyboard and crash this BBS. The BBS would sometimes crash several times a day.

o NITE-LITE BBS -- Paul Swanson's BBS with RAM disk.
Paul Swanson was a programmer from the Boston, Massachusetts, USA, area. I'm not sure whether his BBS for the Atari 8-bit has been placed into the public domain or not. This BBS was the first to support a RAMdisk, which Paul Swanson called a "V:" device for "virtual disk". This BBS was written in Atari BASIC and required a joystick hardware "dongle" device. This was notable as being one of the first Atari 8-BIT BBSes that could actually go for a week without having to be rebooted. Pointers to the message base were kept in an Atari "very long string" (for which Atari BASIC is famous). The BBS would only have problems (for the most part) if this string became corrupted.

o ATKEEP -- An Atari 8-bit version of CITADEL BBS.
I believe that AT-KEEP, like FOREM-XE, requires the use of the commercial BASIC XE cartridge to run. This BBS program was very popular around Louisiana, USA, from what I understand.

o Benton's SMART BBS -- BBS written in BASIC by Marco Benton.
This program is written entirely in BASIC. It expects to be running under a SpartaDOS environment. This was a problem until very recently, when the disk-based version of SpartaDOS was re-released as shareware. This BBS program uses a "modem clock string" rather than an R-Time 8 cartridge in order to retrieve the current time. It also comes with an Atari BASIC game door called "Sabotage".

o FOREM-XE -- FOREM using BASIC XE.
This version of FOREM BBS requires the commercial BASIC XE cartridge in order to run. It is in the public domain and can import and export messages from the Atari PRO! BBS EXPRESS-NET (7-bit text only, control ATASCII graphics are reserved for message data-structure bytes). FOREM-XE BBS is still currently in use as we speak, and may be reached via the PRO! EXPRESS-NET as long as the cross-networking "transnet" is still in effect.

o The BBS Express -- PRO! BBS demo program.
This is the public domain version of EXPRESS!-BBS,
which is the Keith Ledbetter companion project of the EXPRESS!-TERM
terminal program of days gone by. I am not familiar with this program. I
think that it is written in Action! and only supports XMODEM Checksum
transfers. I have never called or seen this program demonstrated.

o OASIS JUNIOR III -- OASIS BBS demo program.
OASIS JUNIOR III is the --ALL MACHINE LANGUAGE--
demo version of the OASIS BBS program. OASIS is very crash-resistant and
comes with a "dial out" screen so that the Sysop can use the BBS as a
terminal program to call and fetch files without having to bring the BBS
down and reload a terminal program. OASIS supports "Door programs" which
it refers to as "OASIS PAL modules". This OASIS demo module comes with an
excellent message system. The OASIS file system is one of the most
complicated that I have ever seen. It consists of "file libraries" with
suites of "file types". There is quite a bit of overhead involved in
performing a download (which may be a good thing, as it discourages file
hogs). There is a commercial version of OASIS called "OASIS IV" that
performs networking. There was an OASIS network between Boston,
Massachusets, USA and Murfreesboro(SP?), Tennessee, USA. Occasionally word
of the OASIS IV developers reaches the network from New Zealand or Canada.

o Frank Walters BBS -- I know nothing about this BBS except that Frank
Walters wrote it.

o Carina BBS -- a shareware product of Shadow Software.

o BBS Express! Professional -- a product of Video 61, www.atarisales.com

o OASIS IV -- a product of ???

o Forem-XE Pro -- by Len Spencer. http://members.aol.com/lenspencer/

Subject: 8.3) What programming languages are available for the Atari?

This section also kept at http://www.student.kun.nl/f.offenga/atari.htm

Revision : 1.3
Date.... : 4/19/1999

==========
!!!! This section is under construction - HELP WANTED !!!!

The goal is to give information about all available languages
for the Atari 8-bit computer. This information will include:
title, last version, author, date and a short description.
It would also be nice to know how to get it and where to get
more information (like reference cards, reviews and such).

Freddy Offenga, mailto: F.Offenga@student.kun.nl
==========

There are quite a lot! To get some structure in this section it's
divided into the following categories;

a) ASSEMBLER
b) BASIC
c) C
d) PASCAL
e) LISP
f) FORTH
g) PILOT
h) LOGO
i) All the rest

The following format is used:

- Language titel (medium)
version, year : version, year
author/company : author/company
available..... : where/how to get it
package..... : programs, documentation
features..... : main features
Description.

The question marks (?) indicate that more information is
required about that topic.

Definitions:
umich University of Michigan Atari archive

Some resources:
- The Multi-lingual Atari, Analog magazine 45, August 1986
- A bunch of manuals
- Some copy-pasted lines from the Atari 8-bit newsgroup

a) ASSEMBLER

- 130XE+ Makro Assembler (disk)
version, year : 2.2, 1992
author/company : Torsten Karwoth
available..... : freeware, ?
package..... : assembler, editor, menu, monitor,
batch enhancement, linker/packer
features..... : macros
Two pass 6502 assembler with integrated menu, editor
and monitor shell. Needs extra RAM banks. Source
format is derived from Atmas Makroassembler.

- A65 (disk)
version, year : ?, 1989
author/company : Charles Marslett, WORDMARK Systems
available..... : freeware, ?
package..... : assembler, manual
features..... : source include
Two pass 6502 assembler. Source format is based on the

Atari Macro Assembler. Assembler source included.

- Alfasm, Turbo-Assembler/16 (disk)
version, year : 1.0, 1990
author/company : Jeff Williams, DataQue Software
available..... : ?
package....... : assembler, docs
features...... : source include
Two pass 6502/65816 assembler.

- Atari Assembler/Editor (cart)
version, year : ?, 1981
author/company : Atari
available..... : ?
package....... : assembler, editor, monitor, manual
features...... : -
Two pass 6502 assembler with integrated editor/monitor

- Atari Macro Assembler (disk)
version, year : 1.0C, 1981
author/company : Atari, APX
available..... : ?
package....... : assembler, editor, debugger, manual
features...... : macros, source include
Two pass 6502 assembler.

- Atmas Makroassembler (disk)
version, year : 2, 1985
author/company : Peter Finzel, Hofacker
available..... : ?
package....... : assembler, editor, monitor, manual
features...... : macros
Two pass 6502 assembler with integrated editor/monitor.

- Bibo Assembler (disk)
version, year : ?, 1986
author/company : Compy-shop
available..... : ?
package....... : assembler, editor, monitor
features...... : source include, data include
Two pass 6502/65c02 assembler with integrated editor/
monitor.

- Datasm/65 assembler (disk)
version, year : 2.0, 1981
author/company : DataSoft Inc.
available..... : ?
package....... : assembler, editor, menu, manual
features...... : -
Two pass 6502 assembler.

- EASMD (disk)
version, year : 1.0, 1981
author/company : OSS
available..... : ?
package..... : assembler, editor, monitor
features..... : ?
Two pass 6502 assembler with integrated editor/monitor.

- Fast Assembler (disk)
version, year : 1.5, 1995
author/company : MMMG Soft
available..... : ?
package..... : assembler, editor, disassembler
features..... : ?

- Kasm65 (disk)
version, year : 2.41, 1994
author/company : Ken Siders
available..... : shareware, umich
package..... : assembler, editor, linker, docs
features..... : macros, relocation, source include,
conditional assembly
Two pass 6502 assembler. Relocatable object files are
compatible with ra65. Source format is derived from
the Atari Macro Assembler.

- MAC/65 Macro Assembler (disk|cart)
version, year : 2.00, 1982
author/company : Stephen D. Lawrow, OSS
available..... : ?
package..... : assembler, editor, monitor, manual
features..... : macros, source include
Two pass 6502 assembler with integrated editor/monitor.
Mac/65 is a direct descendant of the Atari Assembler/
Editor (via EASMD).

- MAE (disk)
version, year : .96, 1996
author/company : John Harris
available..... : umich
package..... : assembler, menu, editor, monitor, docs
features..... : macros, source include, data include,
conditional assembly
Two pass 6502/65816 assembler with integrated editor/
monitor. Extra RAM supported.

- NASM65 (disk)
version, year : ?, 1992
author/company : Nat!
available..... : ?
package..... : assembler, linker, librarian
features..... : macros, relocation, source include
One pass 6502 portable cross assembler (initially for

the ST). Highly compatible with MAC/65.

- PC-65 (disk)
version, year : 1.0 beta, 1996
author/company : Jan Feenstra & Freddy Offenga
available..... : mailto: F.Offenga@student.kun.nl
package....... : assembler
features...... : macros, source include, data include,
boundary directive
Two pass 6502 cross assembler for the PC. The source
format is highly compatible with the ST-65 assembler.

- Quick Assembler (disk)
version, year : 1.0, 1990?
author/company : JBW, Avalon?
available..... : ?
package....... : assembler, editor, menu, debugger
features...... : source include
Two pass 6502 cross assembler with integrated editor.
Very user friendly menu environment.

- Ra65 (disk)
version, year : 1.0, 1989
author/company : John R. Dunning
available..... : public domain, umich
package....... : assembler, linker, librarian
part of cc65 (c-compiler)
features...... : ?

- Synassembler (disk|cart)
version, year : ?, 1982
author/company : Steve Hales, Synapse Soft
available..... : ?
package....... : assembler, editor, monitor, manual
features...... : source include
Two pass 6502 assembler.

- ST-65 (disk)
version, year : ?, 1991
author/company : A. Stauffenberg, F. Offenga
available..... : mailto: F.Offenga@student.kun.nl
package....... : assembler, menu shell, manual
features...... : macros, conditional assembly,
source include, data include,
boundary directive
Two pass 6502/65c02 cross assembler for the Atari ST
written in 68000 assembly. As far as I know this is
the first assembler with the boundary directive.

b) BASIC

- A BASIC Compiler (?)
version, year : 1.03, ?
author/company : Monarch Data Systems
available..... : ?
package....... : BASIC compiler
features...... : ?

- Advan BASIC (disk)
version, year : ?, ?
author/company : Advan Language Designs
available..... : ?
package....... : BASIC compiler
features...... : ?

- Atari 800 Basic (disk)
version, year : 1.0, 1981
author/company : Microsoft
available..... : ?
package....... : ?
features...... : ?

- Atari BASIC (cart)
version, year : Rev.C, 1983
author/company : Atari
available..... : standard ROM in Atari XL/XE
package....... : BASIC interpreter, manual
features...... : pretty plain BASIC implementation

- Atari Microsoft BASIC II (cart)
version, year : ?, 1991
author/company : Atari
available..... : ?
package....... : BASIC interpreter
features...... : ?

- BASIC A+ (disk)
version, year : 3.05, 1981
author/company : OSS
available..... : ?
package....... : BASIC interpreter
features...... : ?

- BASIC XL (cart)
version, year : ?, ?
author/company : OSS
available..... : ?
package....... : BASIC interpreter
features...... : ?

- BASIC XE (cart)
version, year : ?, 1985
author/company : OSS
available..... : ?

package..... : BASIC interpreter
features..... : ?

- Turbo Basic XL (disk)
version, year : 1.5, 1985
author/company : Frank Ostrowski, Happy Computer
available..... : ?
package..... : BASIC interpreter, compiler (V1.1)
features..... : ?
Published in the German magazine "Happy Computer".

c) C

- ACE C (disk)
version, year : ?
author/company : John Palevich & Ralph Walden
available..... : ?
package..... : ?
features..... : ?
This is a newer version of 'Deep Blue C'.

- C/65 (?)
version, year : ?
author/company : OSS
available..... : ?
package..... : ?
features..... : ?
Probably derived from Dr.Dobbs "Small C". Compiles to 6502
code which emulates the 8080 instruction set.

- C65 (?)
version, year : ?
author/company : Keith Ledbetter
available..... : ?
package..... : ?
features..... : good macro assembler
This compiler does not support structs.

- CC65 (disk)
version, year : 1989
author/company : John R. Dunning
available..... : www.cc65.org
package..... : compiler, linker, assembler, librarian
features..... : ?
Public domain compiler. Also used as cross compiler.
Relocatable object linkage files, and the most thorough
K&R C for the 8-bit. Comes with an relocatable assembler.

- CC8 (disk)
version, year : 2.3
author/company : John Palevich & Steve Kennedy
available..... : ?

package..... : Compiler
features..... : ?
ACE C with more "real" C support (e.g. arrays of pointers
to structs). Requires ACE C runtime libs and linker.

- Deep Blue C (disk)
version, year : 1.2, 1982
author/company : John Palevich, APX
available..... : ?
package..... : Compiler, Linker
features..... : ?
Deep Blue C was originally an independent product, but it
then became available from APX. It converts C to pseudo-
code and then interprets the pseudo code (8080 instruction
set emulation).
Drawn from Ron Cain's public domain C-compiler (Small-C).

- DVC C (disk)
version, year : 1.05, 1985
author/company : Ralph E. Walden
available..... : ?
package..... : Editor, Compiler, Optimizer, Linker
features..... : Quite user friendly program
The compiler generates special object files (.CCC)
which can be optimized and linked. The package uses a
special DOS called DVC DOS which contains runtime stuff.

- LightSpeed C (disk)
version, year : 1.08, 1986
author/company : Clearstar Softechnology
available..... : ?
package..... : Compiler, Optimizer, Linker
features..... : ?
Runs under CLI DOS's and MENU DOS's.

- Tiny-C
version, year : ?
author/company : OSS
available..... : ?
package..... : ?
features..... : ?
First sold C compiler by OSS. This compiler was used to
compile itself! First true language "bootstrap" on any
8-bit machine (it was also available for Apple and CP/M
machines). Derived from Dr.Dobbs "Small C". Compiles to
6502 code which emulates the 8080 instruction set.

d) PASCAL

- Atari Pascal (disk)
version, year : 1.0, 1982
author/company : APX

available..... : APX-20102
package....... : ?
features...... : ?

- Draper Pascal (disk)
version, year : 2.1, 1989
author/company : Norm Draper
available..... : ?
package....... : ?
features...... : ?

- Kyan Pascal (disk)
version, year : 1986
author/company : Kyan Software, APX
available..... : ?
package....... : editor, compiler, linker, macro-assembler
and manual
features...... : ?
Kyan Pascal would run off a single floppy. The Atari (APX)
version needs two drives. A version which runs entirely in
128k should be available too.

e) LISP

- INTER-LISP/65 (disk)
version, year : 2.1, 1981
author/company : Special Software Systems, DataSoft
available..... : ?
package....... : ?
features...... : ?

f) FORTH

- ValForth (?)
version, year : ?
author/company : Valpar International
available..... : ?
package....... : ?
features...... : ?

- Extended fig-Forth (?)
version, year : ?
author/company : APX
available..... : APX-20029
package....... : ?
features...... : ?

- fig-Forth (disk)
version, year : 1.4s
author/company : ?
available..... : ?
package....... : ?
features...... : ?

- fun-Forth (?)
version, year : ?
author/company : APX
available..... : APX-20146
package....... : ?
features...... : ?

- Grafik-FORTH
version, year : ?
author/company : ?
available..... : ?
package....... : ?
features...... : ?

- QS Forth (?)
version, year : ?
author/company : Quality Software
available..... : ?
package....... : ?
features...... : ?

g) PILOT

- Atari PILOT (cart)
version, year : 1980
author/company : Atari
available..... : ?
package....... : ?
features...... : ?

h) LOGO

- Atari LOGO (cart)
version, year : 1983
author/company : LCSI, Atari
available..... : ?
package....... : ?
features...... : ?

i) All the rest

- Action! (cart)
version, year : 1983
author/company : OSS
available..... : ?
package....... : compiler, editor, monitor and library
features...... : fast compiler which generates good code
Needs cartridge for runtime procedures. A PD runtime
library is also available.
All variables are static, so recursive routine calls
are not possible. No floating point type (though a
PD library should make this possible). No arrays of
objects (arrays of POINTERS to objects are possible).

- Quick (disk)
version, year : 2.0, 1990
author/company : Raindorf Soft
available..... : ?
package..... : ?
features..... : ?
This is the "poor man's Action!". Same restrictions as
Action! apply also to Quick. Further restrictions are:
only simple assignment expressions, no records and no
pointers.

- Test Computer Language (disk)
version, year : 2.2, 1985-1990
author/company : D.Firth
available..... : public domain, ?
package..... : compiler and editor
features..... : ?

Subject: 8.4) What cartridges were released for the Right Slot of the 800?

Contributors: Gene, Larry White, others

Austin Franklin Austin 80 Console Software
Eastern House KISS
Eastern House Monkey Wrench
Eastern House Monkey Wrench II
Geminisoft/Sar-An Magic Dump
Geminisoft Magic Dump II
Radical Systems Cartridge Maker (eprom burner)
Block (first right cart/first "backup" program hardware device)
R-Time 8 ICD (battery-backed clock, for left or right cart slots)

Subject: 8.5) What games support 4 or more simultaneous players?

contributors to this section:
Jeff M Lodoen, Vidar \"Hawk\" Olavesen, Pat Mulvey,
Steven E. Posey (Party Quiz controllers description), Andreas Magenheimer

The following games support 4 player head-to-head play. Remember, only the
400 and 800 computer models sport 4 controller ports.

Asteroids, Basketball, Dandy, M.U.L.E., Maze War, Silicon Warrior, Survivor,
Thorn EMI Soccer, Major League Hockey

The following support 8 players on the 400/800 or 4 on the other computer
models, using the 2 controllers-per-port CX30 Paddle controllers:

Super Breakout, Worms?

The following supports 4 players on all machines, using special 4-button keypad
controllers linked together with RJ-11 jacks (standard phone jacks) to a box

with 2 joystick port connectors.

Party Quiz by Suncom

Andreas Magenheimer contributes the following:
- Networking 1-8 players/computers games:
Dataque once (1989-1992) developed a Network game+cable which lets you connect 1-8 A8 computers together. The cable (octagon or so) could be selfmade or bought. The game avaiable was Maze of Agdagon (shareware from the Agda Group/Dataque). Maze of Agdagon worked on all 8Bit Ataris with a minimum of 48k RAM. In 1999/2000 Bewesoft discovered this and developed the game Multidash which is network-compatible to the previous game, i.e. it can use the same network cable. But, because of its interlaced grapic mode Multidash will only run on XL/XE computers. Therfore Jiri included a good Gr. 8 picture how to built an easy network cable for 2 players/computers (using a SIO cable as a nullmodem cable!) and an -not so easy - network cable for 2-8 players/computers. The game and its text+picture was released as freeware; it can be found on the internet or the abbuc magazine...

in short: networking games with 1-8 players: a) Maze of Agdagon
b) Multidash

- more multi-joystick games:
MULTIJOY device by Radek Sterba (Raster), supports 8 joysticks attached to one controller port.
Two games by Raster supporting this device: Cervi, Multris.
http://www.infos.cz/raster/atari

Subject: 8.6) What programs run only on the 400 and 800 models, and why?

The following are reported as incompatable with models other than the original Atari 400/800. Most probably do work on XL/XE's if you use a translator to run the original 400/800 OS on your XL/XE.

Apple Panic Broderbund

Konrad M.Kokoszkiewicz writes:

XL/XE software won't work on 400/800 if:

1) it uses shadow RAM at $C000-$CFFF and $D800-$FFFF
2) it uses RAM expansions at $4000-$7FFF controlled by PORTB $D301
3) it uses specific XL OS functions (like JNEWDEVC)
4) it uses illegal XL OS addresses.
5) it uses European Charset :)

Subject: 8.7) What programs make use of the Light Gun or a light pen?

Bertrand M. (LEXX) writes:

Bug Hunt, Barnyard Blaster, Crossbow, Crimebuster, Operation Blood, Operation Blood II - Special Forces (not completely sure about that one), Light Gun Blaster (PD), Gangsterville (Italian game written in BASIC), maybe a couple more...

James Bradford mentions:
"On the 400, the light gun /pen will only work in joystick port 4." This renders much light gun and light pen software unusable on the 400.

Andreas Magenheimer adds:
all Lightgun games can be used with a lightpen (which is not as accurate as a Lightgun however). And: all lightpen games can be used with lightgun. thus add:
- Atari Graphics (Atari) Lightpen graphic software
- 5 Matrix or Matrix 5, a PD game...
- Alien Invaders (DGS) a Space Invaders clone from the brits...
- Bembelwo (Thorsten Butschke) a sort of golf/minesweeper game, written in Quick and PD!
- Sharp Shooter (Mat*Rat) a PD game from Analog, also avaiable on cart from Video 61/Lance Ringquist
- Lightgun Shooter (ABBUC mag.) a simple shooter game, at least PD!
- Flyshot (or Flyshoot) a Turbo Basic game (PD) from ZONG, the KE Soft mag.

Geisterschloss by KE Soft, 1992

Subject: 8.8) What programs have a track ball mode or support a mouse?

Contributors: Andreas Magenheimer, Mirko Sobe

Title	Keystroke Required
Missile Command (Atari)	CTRL-T
Slime (Synapse)	[T]
Shanghai (Activision)	choose controller type: ST mouse ! (plug it into port 2; if you do not have one, you have to reboot!!)
Bombdown (Roemer of Uno)	choose between Joystick, Amiga mouse, ST mouse or CX85 numeric keypad (use port 2 for any mice)
Minesweeper (PPP/PD-World Versand)	use an ST mouse in port 2
The Brundles (KE-Soft/Kaisersoft)	use an ST mouse in port 2
The Brundles Editor (KE-Soft, PD)	use an ST mouse in port 2
Geisterschloss/Ghost Castle (KE-Soft, PD)	choose Lightgun (port 1) or ST mouse (port 2)
10-12 games from ZONG magazine	ST mouse games !! (they use port 2 (KE SOFT, now PD) and a driver called KEMAUS.COM)
Multi-Mouse manager (PD/shareware)	drivers for mice, TB, etc.
Unriagh I (german PD adventure)	has drivers for ST mouse+Joystick (stick=port 1, mouse=port2)

Unriagh II (german PD adventure) has drivers for ST mouse+joystick
(stick=port 1, mouse=port 2)
little Calculator (AMC-Verlag, PD) uses mouse only (port 2)
big UPN calculator (PD) uses ST mouse, TB, Touch tab. and
joystick; (there are different COM
files, rename the one you wish to
use to *.EXE; all drivers use port
1 - if I remember correctly)
Operation Blood (ANG/Mirage) press mouse fire or Select to start
in ST mouse mode (port 2)
Operation Blood 2 / Special Forces press mouse fire or Select to start
(ANG/Mirage) in ST mouse mode
Sprint XL (ABBUC Jahresgabe 1992) uses an ST mouse in port 2
M.O.S. (ABBUC magazine) uses an ST mouse in port 2
Multi-(Tasking-)Operating-System,
Diamond GOS (Reeve software) Version 1.0 (disk), 2.0 & 3.0
(cart.)
support an ST mouse in port 2
S.A.M. (Power per Post) german GUI, supports an ST mouse in
port 2
G.O.E. (TCS) supports an ST mouse in port 1
BOSS-X (MS-Software, Mirko Sobe) supports ST-Mouse in Port 2

RE: Missile Command, Andreas writes:
there are many different versions avaible... I know the old Atari 800
cart version, which works correct with Joystick and Trakball, but not at
all with a mouse. The newer XL version works with Mouse, trackball and
Joystick, also the newest (built-in) XEGS version of MC. But, there is
also a tape version (and maybe a disk version) of MC avaiable. I am not
sure if this tape version behaves like the old 800 version or like the
newer XL and XE/XEGS versions...

And about mice, Andreas adds:
Maybe you did not know, there is a little difference between Trackball
and ST-mouse. Although MC works with both input devices does not mean,
they are the same. they are not !! Connect the TB to an ST computer and
you see: it does not work at all !! You have to do a small conversion to
convert the TB to an ST mouse. (Plans are avaiable from ABBUC, germany).
maybe somebody already did this with Harvey`s TB (and to make things
worse: the old Atari 800 version does not support a mouse; so if the TB
has been converted to a mouse this MC version will not work with it!).

Subject: 8.9) What programs have a paddle(s) or Koala Pad mode?

Andreas Magenheimer contributes:

- Super Breakout (Atari) breakout clone
- Live Wire (Analog) tempest clone
- Live wire 2 (Analog) tempest clone
- Planetary Defense (Analog)

- Pong (Antic) Pong clone
- Pong (Analog) Pong clone
- Super Ball (Compy Shop Magazin) Breakout clone
- Arkanoid (Taito/Imagic) Breakout clone
- Koala/Micro-Illustrator (Island graphics/Koala Ware) graphics program
- Chiseler (Antic or Analog) a breakout clone
- Slime (Synapse) a slimy shooter...
- Chicken (Synapse) catch the chicken eggs...
- many more dozens of Pong and Breakout clones
(forgot their names, maybe someone can help here!)
- many more programs (which I do not remember right now!)

Subject: 8.10) What programs have a CX85 mode?

Andreas Magenheimer writes:

- Multi mouse Management (PD)
- UPN calculator (PD)
- the Bookkeeper (published by ???)
- Bombdown (Roemer of Uno)
- many games from KE-Soft and Powersoft
(forgot their names, help needed!)

Subject 8.11) What programs have a Touch tablet mode?

Andreas Magenheimer writes:

- Atari Artist (Atari) graphics program
- Pixel Artist Deluxe 1.3 (PD) graphics program
- The Brundles (KE-Soft) Lemmings clone
- many more (which I do not remember right now!)

Subject: 9.1) What's this UUEncoding stuff (.uu, .uue files) all about?

UUEncode/UUdecode is a UNIX utility that will convert a binary file into
100% printable ASCII characters, so that the file may be posted or e-mailed
anywhere a text message can go. The 8-bit Atari is perfectly capable of
UUEncoding/UUdecoding as well. On the archives:

Uudecode 1.2a by John Sangster - very functional.
filenames: Archivers/uudecode.bas, Archivers/uudecode.doc

Yet Another UU-coder by John Dunning - both decoding/encoding.
filename: Archivers/yau.arc

Uudecode.com, Uuencode.com by ??? - "newer, cleaner, easier to use."
filename: Utilities/uue.arc

Dumas UU-coder by John Dunning
filename: Cc65/dumasuu.arc

Subject: 9.2) What is an .arc file?

A file with the extender .arc has been archived in a standard manner that
is common in the MS-DOS world. This is done to make the file shorter,
so it takes up less space on your disk and it takes less time to transfer
between computers. The archives contains several 8-bit Atari archivers
fully compatible with this standard, including:

Super Un-Arc 2.3, Super Arc 2.0 by Bob Puff - highly recommended.
filenames: Archivers/superarc.arc - both Super Un-Arc & Super Arc
Archivers/suprarc2.arc - Super Arc
Archivers/supunarc.com - Super Un-Arc
Archivers/supunarc.uue - Super Un-Arc

Subject: 9.3) What are the .DCM, .ATR, .XFD, .SCP, and .DI disk image formats?

These are all filename extensions used to name files containing entire 8-bit
Atari floppy disk images.

DCM - Image format invented by Bob Puff, for his Disk Communicator 3.2 utility.
Used when working with native Atari hardware.
DCM specs at: http://home.planet.nl/~ernest/diskcomm.zip

ATR - Image format invented by Nick Kennedy, for his SIO2PC project.
Used with most 8-bit Atari emulators running on other computer platforms.

XFD - Image format invented by Emulators Inc, for their ST Xformer emulator.
Identical to ATR except without the 16 byte header.
Used with ST Xformer and PC Xformer emulators.

PRO - Image format invented by Steven Tucker, for his APE ProSystem device.
Used with APE, the Atari Peripheral Emulator.

SCP - SpartaDOS SCOPY image file.

DI - Image format invented by Kolja Koischwitz & Christian Kruger for their
800XL DJ emulator for the Atari ST.

One tool for converting among all of these disk image formats is:
Acvt v1.06 by Jindrich Kubec
Latest version can be found at http://www.asw.cz/~kubecj

Subject: 9.4) What are the .XMO and .BIN file formats?

XMO stands for XMODEM. The idea was that the file was not plain text,
but was a binary file. As a binary file, it had to be downloaded using a
file transfer protocol such as XMODEM. The use of ".xmo" as a filename
extender was popular once, but has been discouraged for years.

BIN - another filename extension sometimes used to designate binary-load files. Like .xmo, use of .bin is discouraged.

Subject: 9.5) How can I make my commercial boot disk (tape, cart) into a load file or disk image?

Russ Gilbert writes:

The disk image part is a matter of taking a copyable boot disk and making an atr, xfd, dcm or other disk image type file out of it, usually for use with an emulator. Before emulators, the Bob Puff .dcm format was used to store/archive/retrieve boot disk images.

Almost all commercial software for the A8 is/was copy protected. For boot disks, this usually involved a large number of special formatting that couldn't be copied using ordinary sector copiers. Usually the boot process involved checking to see if a certain sector error occurred, then proceeding. If the error did not occur, the disk was a copy and would not work.

For carts, usually the method of protection was to write to the cart area of memory and see if the value changed. If the value changed, the cart program was in RAM, not ROM and would fail to operate.

For tapes, again a fair number of schemes were used. Some varied the speed at which the tape loaded. I'm not familiar with tape protection schemes.

With all software media (cart, tape, disk), there may be program encryption, which must be decrypted before the program can run. This to make more difficult disassembly of the program.

There were/are a number of products to defeat copy protection/allow copying of protected software for the A8. The most common way to defeat copy protection was to disassemble the software and revise sections of code so that the copy protection was defeated. A software with defeated copy protection is called a 'cracked' software. The basic procedure is to understand how cart/tape/disk software initializes, loads and runs. Usually make a file out of the software and 'follow the code', starting with loading of the program, to decryption to the actual running of the program. Today, it is unnecessary to copy original commercial A8 software because it has already been defeated and may be found at a few ftp sites. (Note umich archive has no commercial/non-shareware software.)

Besides 'cracking' software, there were/are hardware devices to copy commercial protected software. The Happy 1050 and the Archiver, and probably other modifications to the 810, or 1050 allowed 'bit image' copying and reproduction of the special formatting that copy protected disks had. Using these archiving disk drives, a copy of the original disk, including all special formatting and the original code is copied, thus making a copy protected copy, not cracked, just like the original.

For carts, copying could involve cracking or again there were/are products to reproduce the cart and simulate a ROM. Or the cart might be copied and burned on the correct type of eprom, to make a plug in cart. 'The Impersonator', the 'Pill' are two cart copy schemes copy the cart to a file, then don't change the code, but use a 'dummy cart' to fool the software into thinking there is a ROM present.

Basic tools for copying, then cracking, carts and disks are a sector editor and disassembler. Carts are usually most easily dumped using a special OS, like Omnimon, to interrupt the cart and dump memory to disk. There are a few pd cart copiers that have the user plug the cart in when the program is running, I don't believe these pd cart copiers are very good or very wise to use.

So, the basic answer to 'how do I make a copy of my copy protected commercial software' is don't bother. Find it on the net.

There is one exception, in that this 'solution' involves a minimum of effort and is relatively safe. I refer to 'Chipmunk' and 'Black Patch' software to make cracked boot disk copy of commercial disks. HOWEVER, even if you use these two commercial archival tools, be sure you write protect your originals, and be careful not to accidentally write to the original disk.

Finally, I'll mention a very modern (I mean 1997) product. The APE Pro system, by Steven Tucker, in the registered version of this shareware allows making disk images called 'Pro' images. APE (Atari Peripheral Emulator) requires a cable, called the SIO2PC cable, that connects the A8 13 pin serial port to a serial port on the IBM PC clone. To make 'Pro' images, a special adapter cable is needed, not just the 'standard' SIO2PC cable. The 'Pro' image can 'capture' the copy protection of an original commercial disk. The 'Pro' image can then be loaded into an A8 using the APE registered version software, thus backing up your original disk software. Note the 'Pro' image will only be of use to person(s) owning registered APE software and 'Pro' adapter cable.

Subject: 9.6) How can I convert my commercial boot tape into a cassette image file?

Ernest R. Schreurs writes:

For those of you that like ALL classic Atari software, there is now a way to store all software that has been recorded on cassette tapes on the hard disk of your PC. I have written a program that is similar to the SIO2PC utility written by Nick Kennedy. But this one is intended for use with cassette software. You will need the following items:

Any PC equipped with a sound card and about 50 to 100 Megs of free disk space to work with. The sound card should be able to sample sound at a sample rate of 44.100 Hz mono. The sample must be recorded into a .wav file.
You need the wav2cas program to convert the .wav file to a .cas file. The .cas file is a digital cassette image file that only contains the data that is on the cassette tape. Once you have that, you can throw away the .wav file. The .cas files are typically 16 to 64K, so they are relatively small.

To load cassette files into your Atari (i.e. boot a digital cassette image) you do not need a sound card. You do need a SIO2PC cable or similar device. You also need the cas2sio program.

The wav2cas and cas2sio programs should be available from the archives of Umich by now. They have been put together in one zip file wav2cas.zip, along with the documentation and the 'C' source code.
You can download it through the web interface at the URL
http://www.umich.edu/~archive/atari/8bit/Emulators/Peripherals/wav2cas.zip
Note the capital in Emulators and in Peripherals.
Thanks to William Kendrick for helping me get it uploaded there!
You can also try the gopher stuff:
gopher://gopher.archive.umich.edu:7055/11/atari/8bit/Emulators/Peripherals/

Steven Tucker, the author of APE, has added support for this file format as of version 1.15 of APE. It looks real neat, so try that out too! Thanks to Steven for adding a nice user interface for these cassette images. He did a nice job. I am hoping other using are willing to write some programs to get more enjoyment out of this underrated storage medium.

My stuff is available totally free for personal use, so I hope you enjoy it. Read the docs about the conditions.

Subject: 11.2) Can I read/write 8-bit Atari disks on an IBM-PC?

There are several programs that allow an MS-DOS system to work with an Atari-format diskette. The following require a DOS and disk drive on the Atari end capable of the SS/DD 180K format:

ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
filename: Diskutils/atario21.arc

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks.
filename: Diskutils/sr.arc

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. Use MyUTIL!
filename: Diskutils/dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

MyUTIL by Charles Marslett with Mark Vallevand, and
SpartaDOS disk utility by Mark Vallevand
filename: Diskutils/myutil.zip
includes best version of UTIL for read/write of SS/DD 180K Atari disks,
plus Mark's SpartaDOS disk utility v0.1e to access 180K SpartaDOS disks

Ataridsk V1.2 (c) 95-12-09 by HiassofT (Matthias Reichl)
http://www.horus.com/~hias/atari/

MyUTIL and the XF551 - tips from JTKIRK:

]MyUtil works fine with the XF551. The XF551's speed is 300 rpm (sometimes even
]up to 303 rpm). I've got two XF551s and can read/write disks written on a PC
]with MyUtil on both with no problems. MyUtil even can write to a DS/DD disk,
]for a total of 360 K, BUT: the ATARI disks not only have the bits inverted,
]the second side is also read BACKWARDS respect to PC disks. That is, when
]MyUtil on the PC writes to what it thinks is sector 721, it really is writing
]to sector 1440! Worse, if you take an ATARI disk with a file whose sectors
]get past sector 720, MyUtil will attempt to read the sector 2161-n instead of
]'n', and you'll get a 'truncated record' error. The solution is simply to
]rewrite the code to take into account this (if sec>720 then sec=2161-sec).
]Let me know if you modify this. You don't know how frustrating it is to have
]to use only 180 K of a 360 K disk! I'm going to analyze the source code, but
]I don't know if I will be able to modify it properly. If someone does it
]before, please email me and send me an uuencoded copy or tell me where to get
]it.

Here's some advice on using the above utilities from Hans Breitenlohner:

There are two technical obstacles to interchanging disks between
DD Atari drives and PC drives.

1. The Atari drive spins slightly slower (288 rpm instead of 300 rpm).
If you format a disk on the Atari, then write sectors on the PC, it is
possible that the header of the next physical sector will be overwritten,
making that sector unreadable. (The next physical sector is usually
the current logical sector+2). The solution to this is to format all
disks on the PC.
(Aside: Does anybody know how this problem is handled on the
XF551? Is it also slowed down?)
Konrad Kokoszkiewicz answers:
"The XF551 disk drive is not slowed down - these drives are spinning
300 rotations per minute. To prevent troubles with read/write disks
formatted and written on normal Atari drives (288 rot/min), the main

crystal frequency for the floppy disk controller is 8.333 MHz
(not 8 MHz, as in 1050, for example)."

2. If the PC drive is a 1.2M drive there is the additional problem of the
track width. The following is generally true in the PC world:
- disks written on 360k drives can be read on either drive
- blank disk formatted and written on 1.2M drives can be read on
either kind
- disks written on a 360k drive, and overwritten on a 1.2M drive,
can be read reliably only on a 1.2M drive.
- disks previously formatted on a 360k drive, or formatted as 1.2MB,
and then reformatted on a 1.2M drive to 360k, can be read reliably
only on a 1.2M drive.
(all this assumes you are using DD media, not HD).

Solution: Use a 360k drive if you can. If not, format disks on the
Atari for Atari to PC transfers, format truly blank disks on the PC
for PC to Atari transfers.

Jon D. Melbo sums it up this way:
So a basic rule of themb when sharing 360KB floppies among 360KB &
1.2MB drives is: Never do any writes with a 1.2MB drive to a disk that
has been previously written to in a 360KB drive....UNLESS... you only
plan on ever using that disk in the 1.2Mb drive from then on out. Of
course a disk can be reformated in a particular drive any time for use
in that drive. As long as you follow that rule, you can utilize the
backwards compatible 360KB modes that most 1.2MB drives offer.

While the above work with SS/DD 180K Atari-format disks, the following
combination of utilities can be used to work with SS/SD 90K Atari-format
disks, and is currently the best bet for reading SS/ED 128K Atari-format
disks.

AnaDisk 2.07, shareware by Sydex - Reads/Writes "any" 5.25" diskette
filenames: Xf2/anad207.zip, Xf2/anadisk.txt
Apparently 2.07 is buggy.
Anadisk 2.06 is available at: http://ch.twi.tudelft.nl/~sidney/atari/

Deana by Nate Monson - converts AnaDisk dump files from Atari format
filenames: Xf2/deana.com, Xf2/deana.txt

Explanation --> According to Preston Crow:
"As best as I can figure it out, if your PC drive happens to read
FM disks (I'm not sure what the criteria for that is), then you
can read single density disks on your PC by dumping the contents
to a file with AnaDisk, and then using Deana.com to convert the
dump file into a usable format.
For enhanced density disks, Anadisk generally only reads the first
portion of each sector, but it demonstrates that it is possible for
a PC drive to read enhanced density disks."

Subject: 11.3) How do I transfer files using a null modem cable?

This section by Russ Gilbert.

Q: How do I connect two cmputers using a null modem cable?

A: You need a term program and RS 232 ports on both computers. The RS 232 ports need to be connected together using a 'null modem cable'.

For up to 4800 baud, no flow control lines need be connected. Just cross the transmit and receive lines and join the grounds together. Transmit is pin #2, receive is pin #3 and ground is pin #7 on the 25 pin port. 25 pin #2 goes to Atari #4 (XMT to RCV), 25 pin #3 goes to #3 on Atari (RCV to XMT) and #5 of 850 goes to #7 of 25 pin (GND to GND).

The right hand pin on the 'long' side of a female 'D' connector is #1. There are 13 holes on this 'long' side, 12 holes on the 'short' side. The numbers go to the left 1 to 13 then #14 is under #1 and left again so that #25 is under #13.

Most term programs allow a null connection, without a carrier detect. Notably, 'Express 850' does not. I have only used 'Procomm 2.4.3' (the last shareware version of Procomm) on the PC and Bob Term on the Atari, but other term programs may work.

To check your null modem connection, start both PC and Atari term programs, set baud to 2400 or 4800 on both computers. No parity, 8 data bits, 1 stop bit on the PC. Be sure to use the correct COM port on the PC. Go to 'terminal' mode and you should now be able to type on either computer and see it on the other screen. To accomplish a file transfer, use Y-modem probably from Bob Term, rather than X-modem. X-modem will often append bytes to a file transfer, an undesirable event. There is also a very nice Z-modem recieve program for the Atari, called AtarZmodem by Larry Black for the Atari.

A convenient way to make a null modem cable, up to about 30 feet long, is to use two female DB25 connectors (Radio Shack) some three or more conductor cable. Using the two DB25 female connectors allows unplugging your modems and plugging in the null modem cable into the two modem cables. This also avoids the confusion of variations in the computer ports. Most computers connect into the modem end via a standard RS232 DB25 connection. With this both ends 25 pin cable, you would cross pins 2 and 3 and connect the #7s together to make a null modem cable.

The SIO port on the Atari cannot be used directly. An 850, P:R: connection, MIO, Black Box or similar device that provides an RS232 port must be used.

Following are pin assignments for a DB25 pin RS 232 C port.
1. Protective Ground 12. Select Alternate Rate
2. Transmit Data 15. Transmit Clock (sync)
3. Receive Data 17. Receive clock (sync)
4. RTS (Request to Send) 20. Data Terminal Ready
5. CTS (Clear to Send) 22. Ring indicator
6. Data Set Ready 23. Select Alternate Rate
7. Signal Ground 24. Transmit Clock
8. Carrier Detect

For higher speed connections, above 4800 or 9600, you need the flow control lines and Atari term software that has flow control built in. You also need an MIO or Black Box, which uses the PBI (parallel bus). A high speed cable would need not only XMT, RCV, and GND, but also flow control lines. I suggest a commercial null modem from computer store to ensure correct lines. A null modem is a small adapter with the correct lines already crossed. I don't know how to correctly connect the CTS, RTS, DTR, DSR, CRX lines for a high speed null modem. With a null modem, you just plug it into the 25 pin connectors of the two modem cables you might already have connected to your Atari and PC or Mac. You may need a straight thru 25 pin gender changer also.

Following is in this FAQ elsewhere, but I summarize here: (Figure out or look for pin numbers on the ports.) Note that these are pin assignments, and NOT null modem connections with the XMT, RCV crossed and GND straight thru.

Atari 8-bit PC AT 25 PC AT 9 pin
---
1. DTR 20 4*
2. CRX 8 1*
3. XMT 2 3
4. RCV 3 2*
5. GND 7 5
6. DSR 6 6
7. RTS 4 7
8. CTS 5 8
9. No connect? shield RI
22 RI

Note: * above indicates the difference between an AT 9 pin and a Atari 8-bit 9 pin cable connector. eg. If you check continuity from pin 3 of 25 pin end and it goes to pin 4 of nine pin end, you have an Atari serial cable. If pin

3 of 25 pin goes to pin 2 of 9 pin end, you have a PC
serial cable.
(updated 3/1/99)
(DTE = Data Terminal Equipment ie. your computer.
DCE = Data Communications Equipment ie. your modem.)

Subject: 11.4) What is SIO2PC?

From the SIO2PC home page, written by Nick Kennedy:

SIO2PC is a hardware & software package interfacing the 8-bit Atari to PC
compatible computers.

The original idea was to have the PC emulate Atari disk drives so Atari
programs could be stored on the PC's hard (or floppy) drives. It turned out to
be quite successful. About 95% of my work was in the software, but a hardware
device to convert logic levels was also necessary. This device is now commonly
referred to as an SIO2PC cable.

Features:

Emulates 1 to 4 Atari disk drives

Store your Atari files on PC hard or floppy drives

Boot from the PC, real drive not needed to start-up

No software or drivers required for the Atari;
no conflicts: use your favorite DOS

Twice as fast as an Atari 810 drive and more reliable

Co-exists with real drives in the Atari daisy chain

Compatible down to the hardware level: use sector copiers, etc.

Print-Thru captures Atari print-out and routes to PC's printer

Convert Atari files to PC files and vice versa

1050-2-PC version connects PC directly to Atari disk drive

Nick Kennedy
http://www.cswnet.com/~nkennedy/

Another source for building SIO2PC cables is Clarence Dyson's page at
http://www.redshift.com/~cdyson/atari.html

Subject: 11.5) What is the Atari Peripheral Emulator (APE)?

David A. Paterson writes:

"Steven J. Tucker took SIO2PC one better and wrote new software. The Atari Peripheral Emulator (APE for short) lets your PC act as high-speed drives. It lets you print to your PC printer. And it lets you use your PC modem on the 8-bit."

The APE ProSystem goes even further. The ProSystem has two components:

- The program PROSYS.EXE is used to create the protected and unprotected disk images which are then used by APE.

- The ProSystem hardware is a device designed to allow direct connection of a stock 1050 disk drive directly to a PC for use by the PROSYS.EXE software.

APE home page: http://www.nacs.net/~classics/

Subject: 13.19) What's the difference between ASCII and ATASCII?

David Moeser produced this nice translation table.

ASCII TRANSLATION TABLE -- IBM & ATARI 8-BIT (ATASCII)
==========

SECTION ONE: CONTROL CHARACTERS

Subject: 15.1) How did Atari get it's name?

Graham Thornton types:

This article was published in "I/O - The Magazine of the Atari Home Computer Club" in issue 3 - Summer 1983. The magazine was the official mouthpiece of Atari UK. The article was not attributed to any one person. The words are theirs, not mine.

How Atari Got It's Name

The name Atari actually comes from Japan. And yet the company is most definitely American. Every wondered why? It's an interesting story and one well worth telling.

In 1972 three friends decided to invent and market the first commercially feasible video game. They were Nolan Bushnell, Ted Dabney and Larry Bryan.

To become a partner each man had to submit $100 to the project - a remarkably small sum when you consider the company's success! The next step was to find a name.

Drinking beer and thumbing through the dictionary one day, the three friends came across an interesting entry under "S". The word was Syzygy, or "the straight-line configuration between three celestial bodies". What a perfect name they thought, for three such astronomically talented people!

Now they could get on with the business of inventing games. Their first, Computer Space, was produced and all seemed to be going well.

But then things started to get a little shaky. Larry Bryan decided not to ante up his $100 and pulled out, leaving Bushnell and Dabney to go it alone.

The set up a shop in Santa Clara, California, and incorporated the business. A little later they invented Pong(r).

Busnell and Dabney applied for the name Syzygy to the Office of the California Secretary of State, which regulates Californian corporations, but were told that they were too late. The name was already taken.

Following unsuccessful attempts to buy the rights to the name from the first Syzygy corporation, which appeared to be inactive, the friends' solicitor pressed them to think up an alternative.

This proved difficult. BD Inc and DB Inc were tested and then rejected in turn: the first bore too close a resemblance to Black & Decker, the second to Dunn and Bradstreet.

Inspiration occurred at last, once again in an informal atmosphere. Bushnell and Dabney were both keen players of Go, a Japanese strategy game, and their best brainstorming always occurred over a good game and a bottle of beer.

This time, they decided to make a list of several Go words to see if one of them would fly as the new corporate name.

First choice was "Sente", which means "the upper hand" - something that greatly appealed. Second and third choices were "Atari", which has a similar meaning to the English word "check", and "Hanne", an acknowledgement of an over-taking move.

Busnell and Dabney submitted the list once again to the Office of the Californian Secretary of State, which approved "Atari". The rest is history.

When the company name changed, Bushnell and Dabney decided to update the logo too. They incorporated the "S" from Syzygy and the "A" from Atari into the new design.

It was not until later, as the company became increasingly successful, that an advertising agency designed the slicker and now famous Atari logo - the "fuji" or stylised "A" design.

Subject: 15.2) What is the History of Atari?

Here is a very condensed history of Atari, centered around their 8-bit computers.

1972
Atari Inc. is formed by Nolan Bushnell, incorporated on Tuesday, June 27. Atari created the first coin-operated arcade video game with the introduction of Pong. The video game industry was launched and has shaped pop culture ever since.

1976
Warner Communications acquires Atari Inc.

1977
Atari launches the Video Computer System (VCS), later known as the 2600, giving birth to home video game systems.

1978
In December, Atari announces the Atari 400 and 800 personal computers, using the 6502 microprocessor.

ATARI BASIC: (according to Atari BASIC Sourcebook)
Paul Laughton and Kathleen O'Brien - Most of Atari Basic
Paul Krasno - Helped with Trnscendental routines
Bill Wilkinson - Designed Floating Point Scheme
Bob Shepardson - Modified IMP-16 Assembler to accept special syntax tables
Paul invented
Mike Peters - Key punching and operating

1979
The Atari 400 and Atari 800 Home Computers debut at the Winter Consumer Electronics Show (CES) in early January.

Jerry Jessop writes:
"The first official small shipment of the 400/800 was on August 29th 1979. These were hand built pilot run units to Sears that needed to be in stock by Sept. 1 so they could be placed in the big fall catalog. The units were placed in the Sears warehouse and then immediatly returned to Atari after the "in stock" requirment had been meet.

The first "real" consumer units were shipped in Nov. of 79 and were 400's to Sears followed very shortly by 800's."

This extremely long URL leads to Atari's patent for the 8-bit Atari computer:
(thanks Rick Cortese)
http://164.195.100.11/netacgi/nph-Parser?Sect1=PTO2&Sect2=HITOFF&p=2&u=/netahtml/search-bool.html&r=94&f=G&l=50&co1=AND&d=pall&s1=atari.ASNM.&OS=AN/atari&RS=AN/atari

All Atari computers are tested at the factory by a master computer called the Atari Sentinel System.

1981
November: 400/800's begin shipping with the new GTIA chip in place of CTIA, increasing the palette of simultaneously displayable colors to 256 and adding 3 new graphics modes. CTIA is totally phased out by the end of the year.

Jerry Jessop adds:
"The very first proto systems did have the GTIA, but it had some problems and was not released in the consumer version until 1981. The GTIA was completed before the CTIA."

1982
The introduction of the 1200XL in late 1982 marks the single largest advance in the 8-bit Atari system.

1983
In 1983 Atari replaced the 1200XL/800/400 line-up with the new 800XL and 600XL.

1984
Warner Communications sells Consumer Electronics and Home Computer divisions of Atari Inc. to Tramiel Technologies on Monday, July 2.

Atari Corporation is formed by Tramiel Technologies and its products marketed under the Atari brand.

(
Atari Games Corporation is also formed from the former coin-op division and markets coin-op games under the Atari Games brand.

Atari Games was acquired by Midway on March 29, 1996.

January 2000: Atari Games Corp. is renamed Midway Games West.
The last coin-op game with the Atari Games logo: San Francisco Rush 2049, released in 1999.

TODAY
Midway Games West Inc., the former Atari Games Corp., remains a unit of Midway Games.
The following URL remains active: http://www.atarigames.com/
)

1985
The new Atari Corp. delivered on its promise to advance the 8-bit Atari system by replacing the 800XL/600XL with the new 130XE and 65XE in 1985.

Eastern Europe sees the 800XE instead of the 130XE and 65XE, at least initially.

1987
In a change of marketing strategy, Atari introduced the new XE Game System in 1987. Despite its label, the XEGS is a true 8-bit Atari computer system.

1992
Atari (US) officially dropped all remaining support of their 8-bit computer line on January 1, 1992. (Some 800XE's were still being manufactured in China in 1992.)

1996
On July 31, 1996, Atari Corp. became a JTS subsidiary. JTS Corp., with headquarters in San Jose, Calif., was founded in 1994 to design, manufacture and supply enhanced-capacity hard disk drives for the notebook and desktop personal computer markets.

1998
On February 23, 1998, JTS sold its Atari Division to HIACXI Corp., a wholly-owned subsidiary of Hasbro Interactive, Inc., which is a subsidiary of Hasbro, Inc., for $5 million in cash.

(JTS filed for Chapter 11 Bankruptcy Protection on December 11, 1998, and then converted it to Chapter 7 on February 28, 1999)

Hasbro Interactive produced games for several platforms, including PCs running MS-Windows. Some of Hasbro's games, including several re-makes of classic Atari titles, were marketed under the Atari label. The Atari Interactive brand was termed "a Hasbro Affiliate."

2001
On January 29, 2001 Infogrames Entertainment announced completion of its acquisition of Hasbro Interactive from Hasbro. The purchase included the Atari titles and intellectual properties.

TODAY
Atari is a label of Infogrames Entertainment.

Founded in 1983 and headquartered in France, Infogrames Entertainment SA is a global publisher and distributor of video games for consoles (Sony, Sega, Nintendo, and Microsoft), personal computers and Macintosh systems, as well as interactive digital television platforms, mobile smart devices (WAP, HDML) and in-flight entertainment systems. The company's award-winning franchises include Alone In The Dark, Driver, Deer Hunter, Roller Coaster Tycoon, Test Drive, and Unreal. Infogrames' Humongous Entertainment division is a leader in children's entertainment software and its Macintosh publishing label, Macsoft, is the number one publisher of Macintosh entertainment software. With Infogrames Entertainment SA's recent acquisition of Hasbro Interactive, Infogrames now boasts a line of software based on well-known licenses such as Monopoly, Jeopardy, Tonka, and Atari.
http://www.infogrames.com/ .

The Atari website: http://www.atari.com/

Atari currently (9/00) markets:
Atari Arcade Hits 1 & 2
Breakout
Centipede
Frogger
Glover
H.E.D.Z. - Head Extreme Destruction Zone
Missile Command
Nerf ArenaBlast
Pong
Q*Bert
The Next Tetris

Avoiding GOTOs is a means to clearer program structure, not an end in
itself. In a language that doesn't have REPEAT-UNTIL or DO-WHILE loops,
it is clearer to use a GOTO to emulate such constructs (possibly adding
a comment) than to pervert a FOR-NEXT loop. Look at your "improved" code
above: the central idea of repeating something until X<>0 is buried among
assignments to an artificial variable II. In programming as in writing,
one should say what one means.

I'd love to try and convert Winderness Campaign to the A8 using MS Basic, modules, and the COM function. I think it could be done. Would you be willing to send me the source? My real email address can be found at the bottom of the web page at:

http://cth.dtdns.net

Thanks,
Tom

Why not offer it all to anyone in this newsgroup who is happy to come
and collect it and who will make a donation to your local charity
while they're doing it? I live in the UK otherwise that's exactly what
I'd offer to doï¿½ I can understand your not wanting to get into
negotiating on prices for odd bits of hard and software but surely
some dedicated Atarian would like to take the lot off your hands? I
would!

No need to blow smoke up someone's ass who already has a cloud to spare on
his nice 8 bit stuff.

Satc- where do you get all these sweet 8-bitties? You've had some other
titles for trade that are pretty neat. Too bad I never have anything on the
menu.

Well,
Mirko Sobe (Boss-XL, XE, X) "converted" a windows video file for his own desktop. He also wrote a driver for those videos, that can display all *.VID files. Unfortunately, I do not know, how the converted video file must be looking like, nor which Graphics resolution it has to use... His video shows a surfer in Gr. 8 (it is a very very small Gr. 8 screen; 3cmx4cm on my 55cm tv, I did not count the pixels; first the single pics get loaded, then all the graphics get animated; but still the video is one file, not dozens of separate picture files!). maybe you can ask Mirko Sobe (www.atarixle.de or so)how he did it and how you can do it yourself (using his driver from Boss-XL or XE). Maybe we can then start converting plus watching windows videos on the little atari... -andreas.

P.S.: I would prefer Gr. 9 over Gr. 8 (and Hip over Gr. 9 and RIP over Hip; not to speak of 256 colors in a high resolution!)...
P.P.S.: Anyone got a DOS based AVI driver for my PC ??? A friend of mine is just doing an Atari AVI CD-ROM (a CD filled with AVI Atari videos;), but me, I do not have an AVI driver for my DOS/Win 3.11 based 486 PC... (nor for my Atari).

Well,
the standard Atari is a little faster than the C64 (1.8Mhz compared to 1Mhz) and it can also use the 65816 device (I thought this thing would run with 16Mhz, maybe it runs with 20Mhz too). Next, upgrading to 16MB with or without the 65816 would be no problem. Ask Mathy and he will tell you, that the little Atari - provided with a second PIA chip (and maybe other Hardware) can be upgraded to full 256 Megabytes of Ram !! (Megabytes, not megabits!). Never thought that so much RAM would be usefull for such a small machine, but talking of displaying realtime Videos, it might be handy... And who says, that a 65816 (i.e. somewhat 16-bit) upgrade is the maximum you can do for a 6502/atari. it is also possible to do/create a 65832 (or however you may call it; a somewhat 6502 compatible 32-bit) upgrade. A german ABBUC guy once created the 65816 for himself and he told the other ABBUC members, that it would not be a big hardware problem to do a faster and better 32-bit upgrade. But at that time (early 90`s) this was a little to expensive, maybe nowadays it is cheaper... -Andreas

P.S.: Still thinking that realtime videos on an A8 are a little too complicated (a very expensive and time-wasting effort)...

Well,
I would prefer anything but Ultima style games. ultima is good (or
great, however you treat it), but we already have so many ultima-style
RPGs on the little atari.
How about a new 3D RPG game, as mentioned in 2) , 3) and 4) ?!? But it
should be finished - cause I already have quite a lot of unfinished 3D
RPG games...
-Andreas.

While I *really* appreciate that, someone else already posted it here for me. BTW, I *do* include my email. I just put spaces between the characters so that spambots won't pick it up. If you check the header, you will see a line that reads:

From: "Keith Olson" <s p a m t r a p 0 0 7 @ y a h o o . c o m>

While a spambot won't catch it, it's simple for anyone else to take the spaces out again.

Cross-posted to: comp.sys.cbm,comp.sys.atari.8bit,comp.sys.apple,comp.sys.msx

My Windsurfer had a resolution of 64 x 48 pixels using graphics 0 with a changed font. While playing the video from the ramdisk and main memory, I've putted the video-datas into the actually displayed font. But unfortunaly theese video-files are too big for the small ATARI-XLE.
Before I was converting the video, I've loaded the original (color) into COREL PHOTO PAINT, converted it to 64 x 48, 1 bit per pixel and saved it uncompressed. On the ATARI, I wrote a little program, that converts that file into an .ATV file. The ATV-File is compressed. The compression mode is not very complicated, so I was thinking, the ATARI would be fast enough to decompress the video in realtime, but it didn't. So it must be first loaded and decompressed into the memory (...like andreas said: first the single pics get loaded...). Then the video can be watched. The framerates could be up to 25fps. Possible formats are 32x12, 64x48, and 96x72.

yes it came with a driver disk and a schematic. the schematic was the size
of a postcard.. big enough to fit inside the box it came in.

I would imagine so, I installed Basic C (I pulled from a bad 130XE mobo) into one of my 1200xl's (along with the XL OS rom from an 800xl) works like a charm. Used docs off the net to do the install, just can't remember off hand where. But it should be just a drop in for you in your 600xl.

Later,
Brent

Yes the os for the 1200 is different than that of the 600/800xl's which I think are the same os. but the basic c revision is longer by 12 bytes I think..
I dont have a bad mobo and the chip in the 130xe is not socketed so I feel I may damage it if I unsolder it.. I know that it is available mail order and I may need to go that way.. thanks for the input

I've been on the site and have BOSS-X at home. But I really tried it out. SO
I haven't seen a windsurfer yet.

Maybe Roland Scholz' PC-Bridge can help (plus a PC video card). And we'll have
to get the BlackBox to share the parallel bus.

Use XLsearch to find Sexual Experience. It's a polish, two sided X-rated demo.
And you can ofcourse use Raphael J.Espino's JPEG Viewer to watch all them nice
JPEG's of whatever you like. Try the HIP format.

CU Mathy van Nisselroy

3949. MIDI for the 8 bit Atari (Polish software, looking very good)

Newsgroup: comp.sys.atari.8bit
Date: 2001-07-05 09:16:46 UTC
From: nisse-ma@reze-1.rz.rwth-aachen.de
Message-ID: <9i1b9u$f7q$1@nets3.rz.RWTH-Aachen.DE>
Source record: 35823

Howdy folks

The latest issue of the ABBUC (http://www.abbuc.de, mainly in german) Magazin has an article on MIDI programms for the Atari 8 bit computer that looks very good (but I never have used MIDI software and I know barely enough to recognise all the instrument). How about 48 tracks. Textmessages on screen. Up to 300kB of memory use as a buffer (although it probably doesn't support all memory upgrades).

Check out: http://republika.pl/ixkuczek/ixkuczek.html
(which unfortunately is in Polish) But you can find a lot of MIDI files there.

BTW some audio CD's nowadays also seem to have MIDI information on it.

The hardware described (MIDI interface) doesn't seem to be to expensive or hard to build. It uses the SIO port. Lemme do a quick count: 6 resistors, a 74LS00, an Opto Isolator, a diode, 2 transistors, 1 capacitor, 2 5pin DIN plugs (MIDI) and 1 SIO plug. (if you make this one a male plug, you don't have to cut up a cable and you won't have a cable dangling from the interface. Plugs can be had at www.best-electronics-ca.com)

There's also a 'MIDI Out only' version, which needs 1 5 pin DIN plug, 1 SIO plug, one diode and 2 resistors.

Check out 'qv.apm" at http://browser.arachne.cz/dos/ BTW, .APM files are
just ARJ files with what are basically .INF files in them, to act as
plug-ins for Arachne.

It's quite nice but wouldn't you have to use an oddball LCD display? The
console ghoul in me thinks that the PC Engine or SNES might be better
victims.

I agree. Don't waste your time. (And no, Andre, I've never catalogued
my disk software:-)

> > Pharoas Curse
> > Zeppelin

These and other Synapse titles are on the cart lists. Apparently they
were included on the basis of Synapse announcements and the fact that
there are cart size (16K) versions of the games. I once spoke to a
programmer of some of those games and he did not think carts were ever
issued.

> > Matterhorn
Digital Press lists as NR

> > Tapper
Thousands have looked and none have found? Sega listed it in the
instuctions for other games. Also, its catalogue number is lower than
Super Zaxxon, so it logically should have come out. I think its
probably only disk or cassette.

I had always wished for an Atari 8-bit computer using the Maria chip from
the 7800.

The one thing I've always been envious of with respect to the C64 is the
ability to get eight multicolor sprites moving with minimal effort, and the
ability to double that number on an interrupt with moderate effort.

Bill

3964. How to tell which Atari Basic Revision that you have

Newsgroup: comp.sys.atari.8bit
Date: 2001-07-06 04:14:44 UTC
From: w_a_lang <w_a_lang@willinet.net>
Message-ID: <tkaep4q7rcl18d@corp.supernews.com>
Source record: 35838

Hello Everybody,

How to tell which Atari Basic Revision that you have--

The memory address that identifies which Basic that you have is 43234.

So when you start your Atari up, at the READY prompt, type in this command:
PRINT PEEK (43234)

You will get a value of 162 if it is Rev A Basic.

You will get a value of 96 if it is Rev B Basic.

You will get a value of 234 if it is Rev C Basic.

Amateur Atari historian and Devout Atari game player,
Wally

Hi!

I seem to miss the 'artifacting' stuff. Why would anybody want to use it, if it has the same resolution as GR.15 (you need 2 pixels of GR.8 to form one artifacted color pixel) and you can't choose colors freely?

And, please, don't explain me what artifacting is. I know it. I just want to know why to use it while there's GR.15 which has same resolution and better colors.

I found it.. do a search for "schematy" and you will find a polish site
which has English drawn schematics for a LOT of 8-bit stuff. I originally
needed it cause I wanted to wire the schematic like a number keypad and not
a telephone layout like my box was.. it seems someone switched the buttons
around on me..
kids..

Makes it easier to mix text and graphics on the same screen. Ultima III and Caverns of Calisto are to good examples.

I've also done some Koala conversions to GR.8 artifacting and to GR.0 character sets with good results. Just a little fiddling with the color registers and the pictures are virtually equivalent to the originals. I did one Dancing Mickey Mouse demo in BASIC that just used 3 artifacted GR.0 character sets and screen flipping with a changing offset to make it look like Mickey was dancing off one side of the screen and back onto the other. I could have done the same thing with the 5 color character mode too of course.

3975. Converted Tape to .cas File

> form one artifacted color pixel) and you can't choose colors freely?

Well, because it doesn't have the same resolution as GR.15. Consider
the following pixels on the screen:

```
.**. ( . = off, * = on )
^
|
even pixel coordinate
```

On a Gr.8 screen, you see a white dot without major artifacts. If you
plot the same bit-pattern on a Gr.15 screen, you see two dots, one of
color 1 (= 01 for the first two bits) and one of color 2 (= 10 for
the second two bits), hence a pixel twice as large with color shading.

In other words, with color artefacting, you have twice the resolution
for "white" color because even/odd and odd/even pixel pairs result in
the same on-screen color. In Gr.15, you don't.

Another point is that the old Os versions did not support Gr.15.

Anyhow, I never used artifacting, as I live in a "PAL" country, and you
don't see any effictive color artifacts here. Some games loose a lot.

So long,
Thomas

RE: Wanted: Philadelphia-area Atari user to xfer files to PC
BY: Brian Siano to All on Thu Jul 05 2001 22:50:26

> ...complete with both kinds of Atari brand disk drives...

BOTH ? Um... ATARI officially made *THREE* brands of disk drive -- a single density ATARI 810, a "density and a half" crippled ATARI 1050 (that could be made whole with a US Doubler Chip), and a true double-side, double density Mitsumi drive (with shorted cable) called the ATARI XF-551 (the early runs were single sided until they ran out of recycled spares). Then there are third party drives like the California-2000, Indus-GT, and Percoms.

Doing the transfer is no problem. There are several PC programs for transferring ATARI files. There is the oldest program -- ATARIO. Then there is the ATARI 1050 program that can only do one file at a time, called MULE (train), stubborn and slow, but it works. Finally, there is MYUTIL, Charles Marsletts utility for porting over MyDOS files. Your biggest problem is going to be in finding an ancient IBM PC with an old-style 360K, 5-and-1/4, floppy drive in it to accept the 5-and-1/4 ATARI floppies. (NOTE: All the porting programs work only in "single sided" mode, so double-sided, double-density, XF-551 files written in "cylinders" on a 1420 sectored disk will have to be rewritten as single-sided, contiguous, double-density, one-sided files (i.e. no cylinders, one-headed writes, rather than the common two-headed, cylinder writes are preferred.))

I think I may have done something like that once... (or maybe not), and certainly in TurboBASIC. Well, I managed to do a program to find the Eigenvalues of a matrix, that's for certain... Believe me, it's not so hard as you may think it is - just a matter of knowing the proper algorithm implementation.

Send me the details of what you're trying to do and maybe I can help...

> Flip and Flop (FSS)
> Fort Apocalypse (Synapse)
> Jawbreaker II (Sierra)
> Star Maze (Roklan)

These six carts above definitively exist, but are very rare and usually you have to pay a lot of money to get them (I'm sure Gene can confirm that ;). Maybe 'Capture the Flag' exists also, but it's rather unlikely. You can add Roklan's 'Rack 'em up' as existant also (seen on epay).

Btw.: Does somebody know why the First Star titles are that rare? I have no explanation for that, because the game are excellent. Limited release? High retail price? Error-prone hardware? Released during the big videogame-crash?

Hello mathy/andreas, how are things in mainland europe, no more bse or foot in mouth please.. Wer'e british, anyhow how is the atari thang going, keep the faith, and keep atari hummy

Anyhow's Re: Multicart devices for the best 8bit machine

I cant remember were i saw it, but I remeber an article either in dgs's newsdisk, twaugs newsletter or good ol' p6 (page 6- not the hottest part of the sun) But I definately remember an article about multicart devices for the a8, which was based on the 2600's Romscanner devices sold many moons ago (roms scanner , if memory serves me is the technical name for multicart devices

The A8* version could be daisy chained (similar to sio protocol) so that you could have multiple romscanner devices linked together, I think there were 2 versions eith 8 or 10 slot or 20 slot versions, don't quote me on it though

Re: multigames on one cartridge

Easily possible, Atari I believe already did it on one of their xe game's promotion carts, I thinks it had 3 or 4 games one of which was definately star raiders 2 or one on one (ea title), anyhow this system already exists on snes, md, sega ms gg and 8bit nes, though ellicit copying like the fabled 32, 16, or 120 in one games, I actually bought one of these cart's for my brothers gb colour, so I believe the technology is easly transferable on to the a8 system, regardless of bank switching or no bank switching (a technology lest we forget that ATARI invented, if you've ever read the story of the 2600 version of Asteroids)

When someone perfects the atari version of the multigame cart, let me know as I have over 450 (some packed) games on binary (dos format) files that I would like to see on cart, as I have loads incl.. zybex, rockford, kdsm, red max on binary (and they work flawlessy.. that I CREATED MYSELF

Yours Atarily...

Yes, that's the point, I think. My thoughts went in wrong direction
because I just assumed it will lower the resolution by two.

> Another point is that the old Os versions did not support Gr.15.

Which versions support which Graphics? Seems that OS/A / OS/B don't have
graphics 12 and higher? (Error 145 from basic). But Antic supports that
and dlists could be written to use that graphics, right?

> Anyhow, I never used artifacting, as I live in a "PAL" country, and you

Me too, but was lucky and now I have two NTSC ones which work with my
multi-regional TV. Tried Drol, looks very nice ;)

What is strange is that I must move 'tilt' setting to the maximum left
(red) to see colors as described in Atari manuals, but I must set tilt
to center to see artifacted colors. :-/ Tilt is some setting on NTSC tvs
only, I think it's something which sets the correct colours.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

Afaik 16K stripped-down versions often are issued on tape in order to work on 16K computers (most of the Atari 400 owners didn't get disc drives). That would explain why there are two versions of some games without need to speculate on cartridge versions.

Mathy,
I have an original 256K MI/O that works great. An IDE version with 1MB RAM would be wonderful!!!
Oh and REAL serial (PC 9-pin pinout) and centronics parallel ports too.

OT, but related: How hard would it be to build a USB interface and drivers for NON-DOS inkjet printers?

Keith,
I've written some fairly large BASIC XE programs and CAN'T avoid the use of the GOTO command. However, at least BXE has named
subroutines and procedures. You can also GOTO linename or at least add a REM line in the code to state what the point of access
is to do. I use to do that, but it takes up valuable memory.

```
570 REM [some small code to do something]

.
.
.
1530 if x=y goto 572
```

Now this may look like a procedure call or a sub routine, but it may do some specific task that can't be done as a specific
routine call. I don't happen to have any examples on-hand at the moment. I call this glue code to stick program parts together.
It's rare, but necessary at times.

Subroutines, even in Atari BASIC vs XE BASIC, should work and be a bit
easier to translate into other languages.

I've always found starting to write a program as almost an outline of what
you wanted to accomplish then filling in the routines later works well to
structure a program. I will start off with things like the first 5 lines
something like.

```
10 GOSUB INITSCR
20 GOSUB INITHARD
30 GOSUB FLOPPYIO
40 GOSUB ALTCHRSET
50 GOSUB MAIN:END
```

A hardware hack and software that allows an IBM computer to emulate an Atari disk drive for use with a real Atari 8 bit computer.

The conversion you would want is .cas to .ATR or .XFD, the two formats used in the by emulators and SIO2PC as virtual disk drives.

I think the older versions of Xformer don't support .ATR format, not sure about the latest version.

Windows 2000 has a command prompt, but it definitely is not a "DOS Window". It doesn't run DOS, and any DOS software that you run that tries to access hardware directly - and many DOS titles do - simply can't. That means games run without sound because they have no access to your sound card (unless you use SoundFX or VDMSound, which are SoundBlaster emulators for win2k - but I digress), and it also means that Sio2PC and APE, which use low level hardware calls to do their I/O, don't work. Ape 98, despite being a Windows application, was written specifically for the 95/98 operating systems and won't work either.

An author named Dan Vernon has written an APE-like program for Windows 2000, but it's a very plain beta software (runs from command prompt, no GUI, few features). I don't know the website, but he can be reached at: dan (at) bitsofthepast dot com. You can also email me and I'll send you the version I have, which is probably out of date.

(remove "spam" from my address first.)

Good luck,

Hi,
Maybe 10-12 years ago I bought the XF551 disk drive. I used it
for sometime then it died on me. When I place a CD it gives very
strange sound (like a siren) then it gives an error. I don't recall
the error number. Any clue?

I juts a 1050 from ebay, What is the perfect upgrade for this one?

Another alternative would be to get Partition magic or just use FDISK and create a small seperate partition on your hard drive for DOS use. I may be wrong, but I think 2000 uses a different format than dos. You could use a boot disk or boot menu to access the DOS partition. Just a thought.

I have never seen an app to do this; it would be a simple matter for the whiz kid bit bangers as long as the .ATR was a single sided double density 180K image. Most of the recent PC floppy controllers can not read/write/format the FM scheme used on the A8 single density disks; the best they can manage is the MFM double density data storage type.

>Mat_1999 Mat@Mat.com asked:

I always thought it would be neat to have a Zelda type game for the Atari,
and it would not have any problems doing the graphics or sounds like the
NES.

Source record: 35878

Definitely exist:
Alien Ambush (Dana)
Bristles (FSS)
Exidy's Demo Cartridge (Exidy) (not actually a released cart)
Flip and Flop (FSS)
Fort Apocalypse (Synapse)
Jawbreaker II (Sierra) (its actually labeled Jawbreaker)
Star Maze (Roklan)
Synassembler (Synapse)

Probably exist:
Conquest of the Crown (LindaSoft)
Trust (Rantom)
File Manager (Synapse)
Jukebox (Spinnaker) (not sure about this one)

Unlikely to exist:
Letter Wizard (Datasoft)
Sammy Lightfoot (Sierra)
Shadow World (Synapse) ---See my other post on Synapse.
Drelbs (Synapse)
Capture the Flag (Sirius)
Frantic Freddie (SpectraVideo)

Its just my opinion, but have removed a few other titles from Andrew Krieg's list:
Rock & Rhythm (Spinnaker) (just a mistake on the list)
Rosen's Brigade (Gentry) (Gentry didn't make carts)
Dr Goodcode's (Gebelli) (its written in basic)

> Tapper -- confirmed!
A newsgroup member has written me to say that he has one.

What about Roklan's Da'Fuzz. Real or vaporware ?

Gene Gnandt

4007. rare Atari 800 xl carts wanted, generous trade/buy prices included

Newsgroup: comp.sys.atari.8bit
Date: 2001-07-08 04:24:06 UTC
From: Satcom2 <svenhard@primenet.com>
Message-ID: <9iaosl$7ds$1@nnrp1.phx.gblx.net>
Source record: 35761
Cross-posted to: alt.games.video.classic,comp.sys.atari.8bit,rec.games.video.classic

Loose carts are fine, but for the disk games I only want complete/boxed in descent condition with no smooshed boxes.

My price offers (possibly flexible)

Matterhorn cart Atari 800 xl $50.00
Tapper cart Atari 800 xl $35.00
Capture the Flag cart Atari 800 xl $50.00
Espial Cart Atari 800 xl $35.00
The Pharoah's Curse cart Atari 800 xl $50.00
Zeppelin cart Atari 800 xl $60.00
Alley Cat disk Atari 800 xl $30.00
Neptune's Daughter disk Atari 800 xl $25.00
Moebius disk Atari ST $25.00
Ultima 1 (I only need empty box) for Atari 800 xl $35.00

I will trade a Bounty Bob strikes back 800 xl cartridge in nice condition for any of the above games you have totalling $50 or more according to the buy prices.

If you have any of these and want to sell them let me know. I might would consider trading my incredibly rare Battlesphere for Jaguar near mint complete straight across for any $200 worth of these (that is if you have enough of these to add up to $200 according to my pricelist). If you have any of these that you might let go of for something else you want, let me know, I have thousands of games, I might have what you want! PLEASE do not e-mail me at all unless you have a sell or trade offer from this list. Thanks. -Satcom2

> What about Roklan's Da'Fuzz. Real or vaporware ?

I've got 16KB rom dumps extracted from EXE files of these games:
Da'Fuzz, Matterhorn and (surprise, surprise) Hard Hat Mack. Could be
that they planned them on the carts, but then just added short loaders
and made them tape/disk versions.

Or both ;)

BTW: While you cartridge gurus are here ;) what about different versions
of these games: Centipede, Dig Dug, Final Legacy, Jungle Hunt,
Millipede? I've got more than one dump for each game and don't know
which of them are 'original' and which are hacks. Screenshots are here:
http://www.asw.cz/~kubecj/acartdp.htm

Could you check against your collections, please?

Sure. But you couldn't use Os routines for "PLOT" and "DRAWTO" to draw
fancy graphics. Sure enough, most games don't use these anyhow.

So long,

Wasn't their a program called mule that ran on dos?

There are also a couple of hard ware ways round the system incompatability,
One is a US doubler, or Happy chip in the 1050 giving 'true double density'
(what ever that means! After all Near Letter Quality Priting certainly never
was), the other (more commonly avalible) is the Catweasle PCI device which
plugs into the PC mother board and permits several disk formats to be
readable, and almost as many to be writeable in PC drives. It seems a common
device on the pcs of Amiga owners and where ever there is a shop selling
Amiga hardware, you will normaly find they stock the PC version as well. If
your going to be playing with a lot of file transfers, it may be about £60
well spent. Especialy if like me you have more than one type of 'retro
machine' at home looking for disks.

List of formats supported so far are:-

- all PC-formats (180k up to 1440K)
- Amiga DD and HD (also 5.25 inch formats)
- Atari 9, 10 and 11 sector disks
- Macintosh 720K, 800K, 1440K (DD, GCR, HD)
- Commodore 1541, 1571, 1581 (C64, C128 and 3.5 inch C-54 disks)
- XTRA High Density with 2380Byte per disk
- Nintendo backup station with 1600KB format
- Atari 800XL (all MFM formats, FM under development)
- Apple IIe disks (Apple DOS 3.3 and up)
- further 8-bit formats planned

I understand it has a software controller or flash roms, certainly updated
to add further formats are downloadable (basicly, you don't have to buy a
new one to get the latest supported updates).

Yes i'm considering getting one myself at some point.

take a look here:-
http://members.nbci.com/Pairman/Ref.html

The 1050 is the predessesor of the XF551 and lacks 'true double density'.
Most comercial disks were single anyway, those that wern't used the
'Enhanced density' of the 1050 so as to work on the largest number of atari
drives. As for upgrades, Happy is best, US doubler is more common and will
suit retro gamers like me for extra disk space etc.

Are you sure you mean a CD? and not a floppy disk? Sure a cd will fit, but
certainly not recomended.

I know these titles were released on disk and/or cassette, but I've yet to hear
of anyone who owns these on cart. I've never seen them on Ebay either. If you
own any of these on an original cart, please let me know so I can validate it
on my 8-bit list (http://www.execpc.com/~krieg/links/8bit.carts).

Manufacturer Title
--- ---
Gebelli Doc Goodlode's Cavern
Gentry Rosen's Brigade
K-Byte K-razy Antiks (NOTE: This is not the CBS version, K-Byte
alledgedly released this title themselves
before CBS bought it from them. It is true for
K-razy Shoot-out, but I've yet to see this or
K-razy Kritters with a K-Byte label.)
K-Byte K-razy Kritters (see previous)
Roklan Lifespan
Romox Flapper
Sega Tapper
Sierra On-line Jawbreaker II (I've heard that Jawbreaker and Jawbreaker II
may have been the same cart, only the
instructions referred to it as Jawbreaker II.
Anyone have both? Are there 2 different games?)
Sierra On-line Sammy Lightfoot
Sirius Capture the Flag
SpectraVideo Frantic Freddie
Spinnaker Jukebox
Spinnaker Rock & Rhythm
Synapse Drelbs
Synapse File Manager
Synapse Pharoah's Curse
Synapse Shadow World
Synapse Survivor
Synapse Synassembler
Synapse Zeppelin
TigerVision MatterHorn
??? Boot Ease
??? Bumper Bash
??? VisiCalc

Be sure to read "Pockets" <pockets@cix.co.uk> post carefully:

(snip)
>>List of formats supported so far are:-
...
>>- Atari 800XL (all MFM formats, FM under development)

It only supports the MFM double density A8 disks; still working on the FM single density type...

If you have access to A8 double density, you can use software only like HiasSoft's AtariLink for the transfers and you DO NOT NEED the expense of that card.

AtariLink is what I use; a single density 92K .ATR file easily fits on the 180K DD disk and I have my own utility in A8 Basic to write it from the RAMdisk or the DD disk to a real floppy. It currently requires two drives or a RAMdisk and would need minor modifications for swapping on a single drive.

-Ron

Experience is something you don't get until just after you need it.

No. Exidy planned on using an Atari for arcade machines. The cart
demonstrated how the system worked.

> > Synassembler (Synapse)
> > Never seen on cart.
>
I believe these were by special order. Programmers liked the assembler
and asked Synapse to put it on cart. Maybe they did a short run of
them.

The often told "crash" story is that many titles were announced at
computer shows in 1983 and never released. The programs exist in
various states. Never heard of a Hard Hat Mack cart! Maybe Atari
planned as an XE cart?

The Atari 8 bit FAQ was sent out last night, its says there is a list of
vendors here:-

http://www.faqs.org/faqs/atari-8-bit/vendev/

Most common sources now are getting machines that have already been upgraded
by bidding on ebay/yahoo auctions, Refurbs from some of those vendors,
getting lucky at a car boot/thrift sale or items for sale on this group
(which do appear).

As I said, i'm considering it myself because i have more than one retro
computer system with their own disk systems.

How 'true double density' is the US doubler? I would suspect formating on
the atari then shuffling the diak over to the PC for use would be the way?

>I believe these were by special order. Programmers liked the assembler and
asked Synapse to put it on cart. Maybe they did a short run of them.<

Definitely low volume. I found one with a manual about 10 years ago. It has
one of the red translucent cart cases, along with a very non-descript label.
The (disk) Synassembler manual mentions the availability on cart

: Is there such a program? A .cas to .atr?

Don't think so. It wouldn't make much sence to me as .CAS is a
cassette-emulation datafile, while .ATR (or .XFD) is a disk-emulation
datafile. Many commercial tapes can not be converted to disk (in a
standard way), so will not run if converted with a .CAS->.ATR conversion
utility.

That's top-down programming. There's others like bottom-up, where
you write the low-level functional parts first, then organize them into the
whole. And middle-out, a mixed strategy.

Well Keith Olson I would like to have those MS-DOS
programs too, for running those Antic and Analog files
on my Atari800Win emulator.

Wally

Cleaning out the house and have following items for sell, will
consider any reasonable offers.

Atari 800
Atari 800 XL

Also have following cartridges:

Basic Computer Language (Atari CXL4002)
Basic XL with manual (by company called Optimized Systems Software)
Ms. Pac-Man (Atari RX8043)
Pac-Man (Atari CXL4022)
Missle Command (Atari CXL4012)
Donkey Kong (Atari RX8031)
Galaxian (Atari CXL4024)
Wizard of Wor (Midway)

Have following game controllers:

Wico Black Max (2 each)
Wico Command Control (2 each)

Also have assorted Atari manuals.

I'm surprised nobody has mentioned ET Phone Home. 8-) Atari paid big bucks and the game bombed out. Supposedly they dumped the remaining stock in a landfill and cemented it over.

I thought it was alright for a game and it was one of the first to use speech synthesis.

The lack of games killed a lot of the systems. IMHO, that's why the VCS lasted so long. It had more games than you could shake a stick at.

>Without the marketing muscle of someone like Warner Bros, Atari had little
>chance to compete on an even footing.

"Atari" has/had the name recognition to do all the marketing it wanted. Its one of the most recognized names in existence.

It was amazing to see my old program simply by recording the tape
to .wav file, then using WAV2CAS program, then looking at .cas file
with a text reader. It was mainly unreadable, but I could read
sentences here and there! Is that all I can do now? I would really
like to play this game on an emulator. What do people do with .cas
files? I dont want to hit a dead end now

Lot of questions here...
1)Was your program Basic or Machine language?
2)If Basic, was it CSAVEd or SAVE"C: or LIST"C:?
3)Which, if any, emulators accept .CAS files and how do they do it?
4)Could you email me that .CAS file after answering #1 & 2?
Would like to attempt importing to a disk image and examine its structure
.

This one I do own, apparently a nice find, and one I'm happy to have because of how cool of a game it is.

Gawd, I'd really like to trade for some more titles I don't own. I have tons to trade, so if you have 8-bit for trade, please drop me a note. My tradelist is at www.ianoid.com

I've got a nice Excel version of Andrew's list if anyone needs it. After inventorying recently, I made some excel worksheets for most of the major cart computers, and there's no point in everyone not enjoying them.

The old OS (CTIA) did support graphics mode 7 -1/2 the same double
resolution mode as Gr15

Programmers in the old days used artifacting for extra collor's in there
games. I like amaroute in artifacting mode plus a few others. Util's
suffer from this mode.

Hi!

I can't remember who, but somebody asked me for Basic XL/XE decompiling capability in my CHKBAS program. I've added it this weekend, so that I ask that person to check if it really works, because I don't have that many BXL/BXE programs to test.

CHKBAS now can decompile tokenized Basic/Turbo Basic/Basic XL/Basic XE files. Output could be to PeeCee text files or to Atari's LST files. Could be useful to view sources without loading them into emulator and outputting them via LIST command. Also could decompile 'unlistable' files.

As far as I remember, I was able some month ago to read via the 800XLDj directly from a directory of my Falcon's HD. But now it just gives me a loud buzz and the error 163 (in MyDOS). Reading from a DI-Iamges works fine.

BTW, anybody managed to use the DJ succesfully in MiNT? Here it just works with PlainTOS.

salut,
daniel

Howdy Robert, folks

> OT, but related: How hard would it be to build a USB interface and drivers for NON-DOS inkjet printers?

There are special chips available from ScanLogic and maybe also Philips that turn 8 bits into USB and vice versa. The problem is that those people who have the knowledge don't have time.

USB has two problems (of which one might not concern us 8 bitters):

- If you use more then one USB device, all USB devices between the one you want to use and the computer (or hub or switch) have to be turned ON. Otherwise not data will be transferred.
- (this one is probably not critical in the 8 bit scene) USB devices have to be connected in descending order when it comes to their speed. Otherwise the slowest USB device will be the bottleneck and slow everything down the line down.

I have a file concerning Canon BubbleJet printers. It's over 600kB ZIPped. I tried sending it to Ron Hamilton a couple of times, but he never got it (IIRC because it was too big).

>Eigenvalues of a matrix, that's for certain... Believe me, it's not so hard as
>you may think it is - just a matter of knowing the proper algorithm
>implementation.
>
>Send me the details of what you're trying to do and maybe I can help...

Somebody (Peter Spelluci (hope I remember that last name right)) from
sci.math.num-analysis told me to try the following:

Use a matrix. Each column is one signal.
Multiply the transposioned matrix to the matrix.
Invert it.
Multiply again with [transposition of] matrix (not sure about the stuff in [],
but I have the formula printed out at home).
If I multiply result of the above with my incomming signal, I should get a
vector pointing me to where I need to go.

My routine works. Atleast if I file a matrix with 1, 2, 3, etc. I get the
right results. I didn't get any further (untill now) then inverting the matrix
as I thought I had an error. Some entries started to be zero's. When I asked
Peter it turned out that the matrix I used for test purposes (2x4 or 4x2 I'm
not sure) was singular and should return zero's.

On a small matrix, the Atari is fast enough, but I guess what I'm gonna need is
25 x 25 or even bigger matrixes. Calculation time is gonna be long. That's why
I think I'm gonna use this in a seperate file that will calculate the vector
for each remote just once.

CU Mathy van Nisselroy

PS exams are comming up again. So I won't have much time to tinker.

4055. Re: [ANN] 8-bit Atari Elite Demo

Hi all,

OK, I'm back off holiday now and so will try hooking
up my old 8-bit at some time. I'm looking to get a
friend to knock me up an EPROM emulator so that
I can develop the thing direct to cartridge from the PC,
but don't hold your breaths ;-)

Sorry Andreas that you've had trouble running this on a
real 8-bit, I've done the development so far through the
emulator as I wasn't anticipating many differences between
the two due to the quality of A800Win. Plus it makes
debugging a lot easier! Anyone else tried a real 8-bit yet?

Finally, ALL of the code is in assembler EXCEPT for
the ship structures which are in C (which don't count
because they aren't code ;-) The line drawing routines
are a variation on those in the original C64 version
which are actually pretty efficient and after the mods
are a few cycles shorter than the C64 code.

Let me see how I get on over the next week or two
(normal work + family issues coming first naturally).

Regards,

Mark

Mr. Do's Castle was never released as a cart for the 8-bits. It may have been
released on disk, but I'm not certain. There is a binary image of it that is
quite playable. I haven't played it in a while or compared it to the 5200
version. It might be one of 'Glenn the 5200 Man''s 5200 ports.

That binary version is 8KB ROM dump of Atari 8bit cartridge + some
loader, not 5200 port (99,9%).

Andrew,
Greetings. A lot of energy around this topic lately!

> Manufacturer Title
> -------------- -------------------------
> Gebelli Doc Goodlode's Cavern
Title should be "Goodcode's", but its a BASIC prog, so I'd say NR.

> Gentry Rosen's Brigade
Gentry was a discount subsidiary of Datasoft. No way. NR.

> K-Byte K-razy Antiks
> K-Byte K-razy Kritters (see previous)
Have a brown K-Byte Kritters. Think I supplied the cat# for your list
a couple of years ago. After Shootout, Kbyte announced Kritters,
Antiks and Star Patrol Then they signed the agreement with CBS.
Apparently a few Kritters were made, but not Antiks or Patrol.

> Roklan Lifespan
Exists. A couple were offered to newsgroups over the years. Both
sellers were programmers, so i guess there is some question of them
being prototypes and whether the game was released. Its strange that
Antic mag released the thing on disk.

> Romox Flapper
Have it on a Romox cart without a label. Mine may be an ECPC.

> Sega Tapper
Since Ianoid has retracted his claim, I lean to NR on this one.

> Sierra On-line Jawbreaker II (Are there 2 different games?)
Actually there are three different games! Oh boy! JBI the original
John Harris classic was pulled back when Atari sued for it being too
much like Pac-man. A game with the characters changed was issued. JB
for the 2600 says "by John Harris" but its really not. This is game
that was ported to the 800 as JBII. The cart says JB while the box
says JBII. Clear as mud? The JBII cart exists but does JBI exist on
cart? Don't know.

> Sierra On-line Sammy Lightfoot
> Sirius Capture the Flag
> SpectraVideo Frantic Freddie
Don't think so. Vaporous

> Spinnaker Jukebox
Our friend Bertrand M swears it exists.

> Spinnaker Rock & Rhythm
No. Came out too late (1985) to be a cart.

> Synapse Pharoah's Curse
> Synapse Drelbs
> Synapse Shadow World
> Synapse Survivor
> Synapse Zeppelin
No. See my other post on Synapse

> Synapse Synassembler
Yes. See L White's post on this one.

> Synapse File Manager
Don't know, could be the same deal as the assembler.

> TigerVision MatterHorn
Probably NR - digital press lists it that way.

> ??? Boot Ease
don't know

> ??? Bumper Bash
NR. One of several titles that Sirius announced in one of the
instruction manuals. None have been sighted.

> ??? VisiCalc
Yes. Well, sort of. Its actually an "Atari de Mexico" cart in Spanish.
The actual title is "MicroCalc XE version 2.2". Not sure if it is
really Visicalc or just keystroke compatible.

Later,
Gene

: >cassette-emulation datafile,

: like to play this game on an emulator. What do people do with .cas
: files? I dont want to hit a dead end now

A .CAS files is just a way of storing data from cassette. When using the
APE software you can load the .CAS file and load it directly into a real
Atari with a SIO2PC interface. APE just emulates a cassetterecorder and
the Atari wouldn't notice it is just an emulated one.

The author of WAV2CAS (Ernest Schreurs) is a friend of my. He explained me
in detail why he wanted to write such a util when he was busy with it, and
how it works. He's a great Atari collector, thus also collects software on
tapes. After some years the tapes will not be in mint-condition anymore
and will simply not boot on an Atari since the audio on it is too weak or
disorted (the FSK in the cassetterecorder is not able to translate the
audio to binary data anymore).

When making a WAV of the audiotape, a complex PC program can detect the
sinus' in the WAV and translate those to binary data (something like a
software FSK). This binary data is the actual CAS file and is much shorter
then the WAV (it only has to store the 1's and 0's in stead of the whole
sinus').

To be short, if you convert the CAS to ordinary tape, you have a brandnew
(or even better then the original) tape again.

Another thing is, not all software is available on disk, and some can not
be copied to disk either. The only way to use it is using the tape, or a
CAS file.

Technically, an emulator can use CAS-files too, be it that the C: handler
in HATABS is replaced by a H: handler, to have direclty acces to PC files
(I *think* all emulators work this way)
But I don't think anyone is really waiting to load CAS data in an
emulator...

I have recently placed a rev c cartridge basic chip directly into my basic socket. I tested it only by checking the revision however ... and it seems to have been successful. I have found cartridges to be funky at times. Clean the contacts with a pencil eraser. The cartridge socket (on the motherboard) is impossible to clean.

Way back when, I had my hands on a text adventure game like Leisure Suit Larry where the objective is to have sex with the various women you met.

No pictures but interesting sound effects and commentary.

I don't remember the name of it, but it was disk based. I remember hacking it to pieces so that it wasn't that difficult to achieve the objective.

May it had something like "Erotica" in the title.

If the DI image disk is formatted in a normal way, you should be able
to read the directory on the Falcon desktop. Works for me just fine.
99% of time if you cannot read the directory on the GEM desktop you
should be able to read it using the XE or XL.

I believe this was "Softporn Adventure". It was actually the
predecessor to Leisure Suit Larry (LSL1 has the same plot, only
more encounters), though Sierra (or whatever the company was)
didn't acknowledge it for the longest time.

Maybe, depends on semantics...

All of the PC floppy software I have is file oriented rather than disk, so you take individual files from the PC hard drive and write them to a diskette where they are readable by a doubled 1050.

To convert an .ATR file into a complete diskette requires multiple steps for me:
1) write .ATR file to disk on PC 5.25
2) copy 92K .ATR file to RAMdisk of XL256 with DD A8 drive
3) read .ATR file with CIO and write real diskette with SIO resident disk handler.

You could skip #2 by using 2 drives but it seems to take longer; or we could rewrite the ATR2ENHC utility to allow disk swapping...

The actual cartridge address space you can conviently use is 16k. Most of
the cartridge PC boards you will find available will be 8k-16k so it is
easier to use them.

Prices for things like a bank switched cartridge were quite a bit higher
last time I saw them for sale, something like ~$16 for a bare PC board from
Best or B&C. Even doing your own boards if you want to go to that extreme is
a bit pricey. I think the minumum run you can get is ~2-3 boards for a price
of ~$70 total.

The easiest way is (if the tape file consist of one part only) is to
convert to ATR (easy) and hack few bytes here or there. Or if it's
basic, it's possible to take the contens of data from blocks, store it
sequentially and voila - you've got normal basic file, which could be
LOAD "H:FILE.BAS". Cca 90 lines in Perl even with command line handling
;)

I just bought one of the cheesboxes for this exact purpose. It's actually shaped
like a block of swiss cheese, holes and all. I'm quite happy with the output and the
box wasn't that expensive.

All Video Game Advantage (VGA) FS/T lists are updated approximately
every ten days available on the WWW at http://www.io.com/~vga2000/

*IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT*

The 'Sale Conditions' and 'Ordering Instructions' sections are at
the end of this message. Please read them both carefully *BEFORE*
asking any questions, or placing any orders. Thank you!

*IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT*

This list was last updated on 07/04/2001

NOTE: There are currently 1958 ORIGINAL game screen shots available
on my web site, including 52 for the Atari 8-bit computers!

NOTE: There are currently 857 game manuals available on my web site.
Unfortunately, none are for the Atari 8-bit computers, at this time...

NOTE: The Video Game Advantage Definitive Known Software List
Collection list for this system is currently on-line!

I have the following Atari 8-bit software, hardware, and accessories
for sale or trade.

There are a few items that are listed as untested. When I bought
these items I was told that they all worked, but due to a lack of
time, I have been unable to test them myself.

SOFTWARE:

NOTE: If the company name isn't listed, then the game was released
by the same company as the system.

NOTE: All cartridges are loose (ie. without box and manual), unless
specified.

NOTE: Since all cartridges are used, some labels will have small
defects. Major defects will be listed.

ATARI 8-BIT COMPUTER:

Loose cartridges, no box or manual:
$ 2.00 Missile Command
$ 1.50 Space Invaders
$ 3.00 2-pack: Missile Command and Space Invaders

Accessories:
$ 1.00 "A Note Regarding Software" letter: Atari Home Computers
-- some rips
$ 4.00 Atari 1010 Program Recorder Owner's Guide (16 pages)
$ 4.00 Atari 1200XL Home Computer Owner's Guide (20 pages)
$ 8.00 Atari 65XE Personal Computer Owner's Manual (138 pages)
$ 4.00 Atari 800XL Home Computer Owner's Guide (24 pages)
$ 4.00 Atari BASIC Reference Guide: For Experienced Programmers
(16 pages)
$ 2.50 Atari Home Computers: The Next Generation catalog
(32 pages)
$ 8.00 2-pack: Atari Disk Operating System Reference Manual:
DOS 3 (112 pages). Lot also includes An Introduction
to the Atari Disk Operating System: DOS 3 (32 pages)
$ 8.00 Inside Atari BASIC [Atari / Reston] (196 pages)

[Pictures of the items listed below will be available soon]

HARDWARE:

NOTE: The Lots listed below include only what is listed!

LOT #1

ATARI 1050 (127K) DISK DRIVE.

This disk drive does not include the power supply, or Molex
connector cable.

NOTE: Light comes on, and drive tries to read disk, but drive will
not boot up. Sold as non-working item, possibly repairable, for
parts only!

$ 2.00

*****

LOT #2

ATARI 1025 PRINTER, with built-in power cord, and manual.

This item has not been tested.

I have plugged in this printer, and after powering it up the power
light came on and the print head moved.

$ 7.00

*****

SALE CONDITIONS:

1) Sales are first come, first served. If you are looking for
something that isn't listed, please don't ask (because if I
had it, I'd list it).

2) Everything is sold as is. Unless specified, all games and systems have been tested and are in working order. I very rarely sell items that aren't working, but if I do, they are clearly labeled as such.

3) Trade offers, in particular for items that I need, will be considered (especially if the trade offer overwhelms me). I collect for over 50 different systems, so please feel free to send me a trade list. My want lists are on my web site.

4) Buyer has ten (10) days to send payment, and pays all shipping costs. Shipping cost depends on both the weight of the order and the distance that the order must travel, unless a set amount is already listed. No orders will be sent C.O.D.

5) Since items will be held specifically for you, if you aren't serious about buying, please don't place an order!

6) No package deals on games or systems. All prices are clearly listed. There is no minimum order.

7) If you have a problem with the listed price, please remember that nobody is forcing you to buy from me. I have been in business since 09/05/93, so I have a good idea how to price items. My personal philosophy is that something is only worth what someone is willing to pay for it.

8) Payment must be made in U.S. funds (either check, money order -drawn from a U.S. bank branch-, or cash. Orders from outside the U.S. are also accepted (also, please check out my want lists, since some items are only available outside the U.S.)

9) I reserve the right to refuse any sale or trade offer, and to correct mistakes made while typing this message.

*****

ORDERING INSTRUCTIONS:

To reserve any item(s) listed here, please do the following:

1) carefully read the SALE CONDITIONS section first,
2) please make sure that you are going to follow through on your order *BEFORE* you place it,
3) next e-mail me a list of the items that you are interested in (please quote from the FS/T message, but not the entire thing!),
4) also include your full name and full postal mailing address (this information is for internal VGA use only, and is REQUIRED!),
5) I will reply with a shipping information message for your order.

Thank you!

>How Can I Write an ATR to a DISK using my PC 5.25 Disk Drive ? <== Where can I get this PCI Card?<

While getting things back and forth to a PC is a common issue, this is likely the worst solution.

Here are the solutions that I have used:
Happy 1050
XF-551 with CSS upgrade
Software program (UTIL, ATARIDSK, etc.)
Black Bod/Floppy Board

4099. Re: How Can I Write an ATR to a DISK using my PC 5.25 Disk Drive ? <== Where can I get this PCI Card?

>How Can I Write an ATR to a DISK using my PC 5.25 Disk Drive ? <== Where can I get this PCI Card?<

(Sorry- somehow hit a "magic key" and the unfinished message got sent.)

While getting things back and forth to a PC is a common issue, (IMO) this is likely
the worst solution.

Here are the methods that I have used:
Happy 1050
XF-551 with CSS upgrade (360/720)
Software program (UTIL, ATARIDSK, etc.)
Black Box/Floppy Board
SIO2PC, APE (MS-DOS)
APE for Windows 95/98

True enough, if you have only a few files to transfer, then the software-only method can work. But if you have a number of disks, then SIO2PC or APE is the way to go. Perhaps others have had better experiences with 1050's, but the number of errors that I have encountered in using a DD 1050 to make transfers has made this a very poor choice, at least for me. An XF551 does a better job but still is only well-suited to small scale transfers.

Me too, many years ago I had it down to do a
Bard's Tale type game but using the dungeon
generator from the wonderful Telengard. I think
I got as far as implementing the screen layouts
but not being a graphic artist gave up on trying
to rip graphics from the Atari ST's Bard's Tale
and Dungeon Master.

> also we do not have any Japanese

I've read that it can convert both NTSC and PAL comp. vid. to VGA 640x480.
For US Atari users, with a PAL upgrade to your Atari, you could run a ton of
neat European software.

4102. Looking to buy complete Atari 800 System

Source record: 35726

Hi, I am interested buying a complete Atari 800 systems. The items
that I am specifically looking for are:

- Atari 800 computer w/ 48K RAM and (10k?) ROM
- Atari Basic Cartridge
- Monitor (an Atari monitor would be a big plus)
- Atari Disk Drive (2 would be great)
- All of the power supplies and cords to connect everything

The following items would be a big plus:
- An Atari printer
- Pac Man Cartridge (My wife loves Pac Man)
- Joy sticks
- modem

If you are interested in selling a system like this please e-mail me a
list of the system components and you asking price at john@jrcc.net

Thanks,
John

Not nearly that easy, even though it *is* a single part SAVEd Basic tape. Your logic is what I was thinking until I looked at the .CAS file. He played the tape to a .WAV sound file and then used Bo's wav2cas utility. The resultant file is some hybrid which I will send for your perusal. I can't find any recognizable tokens or FP numbers or a VNT, but some ascii strings are present along with some apparent variable names and possible line numbers. There are no Basic keywords, so is definitely not LISTed...

Well, least elegant, maybe.. But it requires no buying or making new hardware if you already have a PC 5.25 and an Atari DD drive such as Happy, Doubler, Percom, XF551, Rana, Indus, or equal. It is a matter of writing a file on one system and reading it on the other just like a user group meeting. The only wrinkle is duping a complete disk, which I solved with a quick Basic ATR2DSK utility.

4105. Re: Do you own any of these Atari 8-bit carts? Do they exist?

Newsgroup: comp.sys.atari.8bit
Date: 2001-07-10 14:59:19 UTC
From: krieg@earth.execpc.com
Message-ID: <3b4b18e4$0$12828$272ea4a1@news.execpc.com>
Source record: 35729
Cross-posted to: comp.sys.atari.8bit,rec.games.video.classic

Thanks to everyone for their great feedback. Based on what was reported, here are the changes I've made to the 8-bit cart list. Of course, anything can be changed back if someone reports differently. The full list is at: http://www.execpc.com/~krieg/links/8bit.carts

Questionable titles that do exist:
Atari Mexico MicroCalc XE version 2.2 ER [ ][ ][ ]
Sierra On-Line JBL-202 80 Jawbreaker II[label reads Jawbreaker] R [ ][ ][ ]
Spinnaker JUK-AT Jukebox ER [ ][ ][ ]
Synapse <none> Synassembler ER [ ][ ][ ]

Prototype only carts:
Roklan 83 Lifespan PR [ ][-][-]

ECPC only carts:
Romox <none> Flapper

Never released carts:
Gebelli Doc Goodcode's Cavern NR
Gentry 83 Rosen's Brigade NR
K-Byte K-razy Antiks NR
Sega Tapper NR
Sierra On-Line Jawbreaker NR
Sierra On-Line Sammy Lightfoot NR
Sirius Bumper Bash NR
Sirius 83 Capture the Flag NR
SoftCountry Chessmaster 2000 NR
SpectraVideo Frantic Freddie NR
Spinnaker Rock & Rhythm NR
Synapse Drelbs NR
Synapse File Manager NR
Synapse Pharoah's Curse, The NR
Synapse Shadow World NR
Synapse Survivor NR
Synapse Zeppelin NR
TigerVision 84 MatterHorn NR
VisiCorp VisiCalc NR

Regarding a discussion on Da'Fuzz, I was sent scans of this cart a while back. I will see if I can dig them up. It may be a prototype only game though, like Lifespan and Pursuit of the Pink Panther. All of these turned up around the same time when the son of a former Roklan employee sold off his dad's stuff.

Regarding whether or not Tapper exists in any format, I have a binary. Don't know the source, but I would guess it was released on disk or cassette by Sega.

Here's a couple more questions I'll throw out. Anyone have "Leo's Links" for the Chalkboard peripheral? That's the only title for that device that continues to elude me. Also, what is "Trust" by Rantom supposed to be? Is it a game?

> know the source, but I would guess it was released on disk or cassette by Sega.

Is it '(p) Phleghm Hacker'?

> Also, what is "Trust" by Rantom supposed to be? Is it a game?

I've got the binary. 'Rantom Presents Trust (c) 1983 Ted Neville'. Not a
cart dump.

Good luck

Well specced up 800s are hard to come by and pricey if you can find them.
I'm not sure if Atari did a monitor untill the XE days, so alas it proberbly
won't match in colour.

Take a look at the list of vendores in the FAQ for getting refurbished
machines (pricey) or start raiding thrift faires etc.

4108. Wanted: Complete Atari 800 System

Newsgroup: comp.sys.atari.8bit
Date: 2001-07-10 15:47:07 UTC
From: john@jrcc.net
Message-ID: <de16c5ec.0107100747.5bbd65f0@posting.google.com>
Source record: 35732

Hi, I am looking to buy a complete Atari 800 System. What I am
interested in is:

- An Atari 800 w/ full 48k RAM, (10k?) ROM
- Atari Basic Cartridge
- A Atari floppy disk drive (preferably 2)
- A color monitor (preferably Atari)
- All of the power supplies and cables to connect everything.

Other items of interest in the system are:
- Joy sticks
- A printer (preferably Atari)
- A modem
- The Pac Man cartridge game (My wife loves Pac Man)
- Any other games/software that might be included.

If you are interested in selling a system like this please contact me
with a list of the system components and your asking price at
john@jrcc.net.

Or, if you know where I can buy a complete 800 system I'd also
appreciate the info. (I'm already aware of the Vintage Computer
section on eBay)

Thanks,
John

I think it was, I've got the following *dodgy* :-) pinball games on a
compilation disk someware. Most created with the pinball construction kit
IIRC.

Screwball
Carnival Pinball x
Pussy Galore
Balls and Boobies
Knobs and Knockers
Moon Lover
Brians Pinball
Centre Shot Split
Black Hole

Wonder if thats the one I've ended up with, the sampled section is something
like

"yeh you really got me, you really got me now, you know I don't know how you
do it"

Yep,
take a look at those many NTSC pinball versions of PCS; next use the PCS color converter (Gr.15) from Mathew Trimby (PD file, written in Atari Basic) and see what happens! You will gain colors, but therefore you lose resolution !! Part of the pinball display screen (i.e. the score/highscore) gets unreadable then...

Well,
could also be, they released them for Atari 400 or Atari 600XL, which had both 16k RAM. Here in europe, the 600XL had been selling for more than 6 months, before the 800XL arrived. Maybe some companies created smaller games for this (these) machine(s) then... -Andreas

P.S.: Maybe some americans do not know, the atari 800 was officially shipped to europe (or at least Germany) in 1982! Only one year later the XL models arrived, thats why most western-europeans have XL computers...; the XL machines however were not officially sold in eastern-europe (nor the 400/800 line), so most Atarians there have XE models with 130XE motherboards (no matter if they have a 65XE, 800XE or 130XE; all eastern-europe models have 130XE motherboards, just the RAM chips and the Gate-Array were missing on the 65/800XE)...

Well,
some are of course VCS 5200 conversions from Glen the 5200man, some are hacks and finally, some are the official versions produced by Atari in different years (produced for 400/800 line with brown/orange labels, produced for the XL line with silver labels and produced for the XE/XEGS line with grey cases). Even Atari did produce some different game versions, no-one really knows why... -Andreas

RHamiIton5 <rhamiiton5@aol.comedy.com> wrote
: Qrawl sent me his .CAS file from his tape thru wav2cas and it is an
unusual
: data format...

: It sounds from your reply that APE takes the .CAS file and creates tones
for
: the Atari to emulate a cassette load.

No, APE doesn't create tones. It only reads the .CAS file and output it as 600 baud serial data (this is the data coming out of the FSK decoder from the Atari tape-recorder. Audio on tape goes into the FSK, binary data will come out).

: Qrawl *IS* wanting to load .CAS data into an emulator or convert it to
machine
: readable format. How would you do a CLOAD or LOAD"C: in the emulator with
the
: H: handler and a .CAS file?

That's what I explained (or tried to :-)). Afaik you just can't use the CLOAD, LOAD "C:" or any "C" related command in an emulator since it usually hasn't got a "C:" in HATABS, but an "H:" device in stead (Please let someone correct me if I'm terribly wrong, I'm not that a great emulator user. I prefer the real thing).

It MAY BE that enabling the BASIC Rom-file in the emulator places the "C:" back into HATABS, but I'm not sure about that. I never use BASIC.

I've got four big boxes of 8-bit compatible joysticks , tracker balls,
joypads and similar control devices to get rid of.

Most are either boxed or in "nearly as new" condition as I inherited them
from someone who used to supply retailers with them

There are about 50 of 'em in all so, if there's a particular type you've
always wanted (and I've found some pretty weird-shaped ones), chances are
I've got one (or more) of them.

I'm giving them away for just the price of the postage to wherever you are.
If you are outside the UK you can pay in your local currency.

One day I'll take a long holiday.....

:-)

E-mail me at joystick@spheroid.demon.co.uk with what you're looking for and
for which computer and I'll open all the boxes on Saturday and honour as
many requests as I can.

Aha. Day has 24 hours. 6-7 hours of sleep. Cca 10 hours in work. Still
have cca 8 hours for different things. Some shopping, some housekeeping,
reading newspapers. Max 2 hours. 6 hours per day left + cca 30 hours at
weekend.

4126. Basic Dialects

Newsgroup: comp.sys.atari.8bit
Date: 2001-07-10 22:07:25 UTC
From: Jindrich Kubec <kubecj@asw.cz>
Message-ID: <3B4B7C9D.90431F53@asw.cz>
Source record: 35656

Hi!

I wonder how many basics do we have for our 8bits? I gathered these:

I) Atari Basic.
a) rev A
b) rev B
c) rev C

II) Microsoft Basic
a) 'Atari 800 Basic V1.0 (c) 1981 Microsoft'. (Contains string
'WRITTEN BY WEILAND & GATES' and MICROSORT)
b) 'Atari 800 Basic V2.7 (c) 1981 Microsoft'. (Contains string
'WRITTEN BY WEILAND & GATES')
c) 'Atari Microsoft Basic II v2.0 (c) 1982 Microsoft' - 16 kb
cartridge

III) Turbo Basic
a) v. 1.5 XL/XE

IV) Basic A
a) 'OSS Basic A+ v3.00' (hacked version)
b) 'Basic A' (seems hacked too)

V) Basic XL
a) 'Basic XL 1.02 (c) 1983 OSS inc'
b) 'Basic XL 1.03 (c) 1983'

Both on OSS carts.
But I've found 13kb binary 'OSS Basic XL Version 1.00 Copyright
1983, 1984 OSS, Inc.'. Is it a runtime or what?
Another binary is 4kb EXTEND.COM which is needed for 'PROCEDURE' and
similar keywords (?)
Is there some dev. kit or additional diskette which was shipped with
Basic XL?

VI) Basic XE
a) 'Basic XE version 4.1 (c) 1985 OSS, Inc

There's 11kb long binary called BASICXE.OSS containing some
extensions. Also - is there developer's kit for Basic XE?

So, could some kind soul send me these files/images of disks:
1) Any 'original' of Atari 800 Basic by Microsoft.
2) Any 'original' version of OSS Basic A+ (and some distribution disk
image).
3) Any diskette shipped with Basic XL containing BASICXL.COM and

EXTEND.COM.
4) Any diskette shipped with Basic XE containing BASICXE.OSS.

I need such files for improving my CHKBAS program.

>I'm not sure if Atari did a monitor untill the XE days, so alas it proberbly won't match in colour.<

Did Atari ever release any 8-bit type monitor? I know there are a few prototype (XE-style) composite monitors, but I know of none actually manufactured on a production basis except for the ST (RGB-analog) and maybe a VGA for the Falcon?

> I think you're right about Microsoft Basic, now that I think about
>it.. I remember loading a floppy disk instead of the cartridge.

MS-Basic was originally on a disk in '83, but I have the cart Atari released a few years later.

>Reading that txt file was amazing. Please tell me how you converted
>it to that nice clean listing. I have some more tapes Im going to
>convert to .cas. Is there a program that converts it to that txt
>file you sent me?

Atascii <--> Ascii is a snap these days with all of the utilities; used to do a global replace in SpeedScript or TextPro. Jindrich Kubec did the difficult part of discovering which app to read it and list it out. If it had been Atari Basic, you would just remove the Wav2Cas heading and LOAD it in then LIST it out.

> Damn, I really need to hook up my 1200XL and start
>archiving some disks. Too bad I dont have the tape unit anymore.

Wav2Cas seemed to do fine; though might be tedious to convert very many.

Well, I never finished... I still have all the documentation I got, even source
code from a player for the PC speaker. I got so far as to writing a program that
would read the MIDI events from a file and display them (as text) on the screen.
I would need to contact somebody who knows how to work with POKEY...
Analyzing it, a .MID file wouldn't be so difficult to convert into a .AMS file,
note values are offset by an "almost nice" value (something like $21 or so).

Not THAT easy. Every tape block in CAS file (beeeeeeep) has its own
header. File has header. Each tape block (on real Atari tape) has
header. All of these must be checked and stripped out.

Be carefull what you say. On January 1st of 2002, 12 countries in Europe will switch from their current currency to the Euro. Meaning that you can only exchange their current currency in banks shortly after that.

Germany, Italy, Netherland, Greece, Finland, Luxemberg, Austria, France, Belgium, Ireland, Portugal and Spain are the countries that will have the Euro from January 1st 2002 IIRC

>victims.

Do you mean to say that the electronics that control the LCD (flip the
crystals) are inside tghe Game Boy Advance's video chip?

The problems with most of these video chips is that they are no longer made.
Meaning you have to either scavange older computers/games or find a supplier
that stil has them. How would you like it if some bozo that uses a different
computer buys all of Best Electronics' and B&C Computervision's ANTIC's?

Hmm, if we have 9 of the Nintendo video chips, each controlling 240x160 pixels,
we could get 720 by 480. (would be great if it would be possible, but I guess
it isn't)

I can't say for sure, never seen reference to any

I myself am using a commodore 1084 stero monitor (A re-badged phillips model i belive) attached to my towered Amiga 1200 or my 130XE (i can only play games on one machine at a time anyway:0)). I first Atari 8bit Monitori ever saw was also based on the same phillips machine, This was after the first ST monitors when 8 bitters started asking for monitors. I also have an old 14 inch TV as well which i used before i got the monitor. Both gives sterling service and great picture quality despite both being around 20 years old. The TV is now serving as my bedroom TV with a muti-format VCR plugged into it, I am considering trying the commodore monitor on it some day, but hav't been bothered yet.

If you see an old phillips or daewo or commodore compisite video monitor, grab it! I found that an audio Din to 4 RCA plugs adapter (£5 from maplins) works very very well as a monitor cable (Din being the Atari end, RCA the other) though getting hold of a ferrous ring could improve things slightly if you notice interfeareance.

4141. Re: Advanced Programming Structures

Newsgroup: comp.sys.atari.8bit
Date: 2001-07-11 13:40:57 UTC
From: dalloff@gcfn.org
Message-ID: <9ihl19$9j9$1@acme.gcfn.org>
Source record: 35665
Cross-posted to: comp.sys.atari.8bit,comp.sys.apple2

A couple of notes...

First of all, why do in a dozen lines of code what you could do more easily in two or three? The example was "DO...UNTIL X<>0" and included a FOR...NEXT loop to emulate it. In Applesoft, you're a whole lot better off simulating that structure with...

```
60000 X = 0
60005 (doing stuff that may or may not change the value of X)
.
.
.
60050 IF X <> 0 THEN RETURN : REM Or IF X<>0 THEN 60060 if not a sub
60055 GOTO 60005
```

Yes, it includes the dreaded GOTO (twice if not called with a GOSUB, in fact!) but while that will make PASCAL programmers sneer at you, it will run more efficiently in Applesoft because the program structure involves fewer instructions, fewer compares, and no danger of leaving crud on the system stack.

On a related note, it is VERY BAD FORM to jump out of a FOR...NEXT loop anywhere other than at NEXT. Not only that, it's a good habit to get into to make sure that there is one and only one NEXT instruction. Using multiple NEXTs will work, but because the exact performance of the routine may be unpredictable, you increase your chances of triggering a ?NEXT WITHOUT FOR error. Jumping out of a FOR...NEXT loop without allowing it (or forcing it) to complete will, at the very least, create memory leaks, which is the last thing you want when there is a very good chance that your program only has $17FF bytes available for code and $5CFF bytes available for variable storage (assuming DOS 3.3 and a desire to not clobber the hi-res screen).

I should also note that in ObjectPAL, some jerk left out the GOTO instruction. So I have Paradox scripts which have "IF..ENDIF" constructs from hell because there is no way to simply jump out of the program structure. Actually makes the program structure HARDER to read.

Robert S Ely (rsely74@optonline.net) wrote:

: I've written some fairly large BASIC XE programs and CAN'T avoid the use
: of the GOTO command. However, at least BXE has named subroutines and
: procedures. You can also GOTO linename or at least add a REM line in the
: code to state what the point of access is to do. I use to do that, but
: it takes up valuable memory.

GOTO can be very useful. In particular for simulating an IF...THEN...ELSE:

```
100 IF K% <> 255 THEN 150
110 IF LEN (Q1$)<2 THEN Q1$="":GOTO 200
120 Q1$=RIGHT$(Q1$,2)
130 GOTO 200

150 Q1$=Q1$+CHR$(K%-128)

200 VTAB V:POKE 36,H:PRINT Q1$;" ";Q2$;" ";
```

Which is the equivalent of:

```
IF K%=255 THEN
IF LEN (Q1$)<2 THEN Q1$=""
ELSE
Q1$=RIGHT$(Q1$,2)
ENDIF
ELSE
Q1$=Q1$+CHR$(K%-128)
ENDIF
VTAB V:POKE 36,H
PRINT Q1$;" ";Q2$;" "
```

I suppose if you really don't want to use GOTO you could simulate it using
a tactic we use in 6502 Assembler to avoid using JMP:

```
SEC
BCS JumpTo ;Simulating a JMP JumpTo
(code to be skipped)
JUMPTO (code continues here)
```

In BASIC you could do the same thing:

```
2300 Q=5 : IF Q=5 THEN 2400
2305 REM Skipped code (probably an ELSE emulation) continues here
2400 REM Continue here
```

...But why would you want to other than to avoid using GOTO? In Assembler there is a definite reason...BCS is relocatable because it is a relative jump while JMP is absolute. But in BASIC it's just the waste of eight tokens and a perfectly good variable.

```
: 570 REM [some small code to do something]

: .
: .
: .
: 1530 if x=y goto 572
```

```
: Now this may look like a procedure call or a sub routine, but it may do
: some specific task that can't be done as a specific routine call. I
: don't happen to have any examples on-hand at the moment. I call this glue
: code to stick program parts together. It's rare, but necessary at times.
```

You mean something like some of my input routines:

```
60000 Q1$=""
60001 (actual string input routine sits here, outputs to Q1$)
6000n RETURN
```

In some cases I enter the routine at 60000, to provide the user a blank input field. Or, if there is a default value, I put the default value in Q1$ and enter the routine at 60001. By the way, the input routine loop is built with a GOTO, with an IF K%=141 THEN 6000n to exit. Anybody who programs in Applesoft probably recognizes K% as containing the value from the soft switch at $C000... 8-)

I wrote an X-Men adventure game for the Atari 8-bit, way back when, using the adventure game generator from Analog magazine. It allowed you to do some nasty things with the female team members if you tried (some secret back door porn). I posted it on Compuserve way back when but I don't know if anyone ever downloaded it. I'm sure I must still have a copy somewhere I could post to one of the ftp sites if anyone would like to try it. The puzzles are kind of challenging too.

The only bad thing about the generator is that you had to find the 'exact' verb for actions, but otherwise it created nice games. Many of the adventure games in Analog were generated from this tool.

I'm not aware of any problems with those carts.

There is a list of the 400/800 only carts in the FAQ if i recall. I think its only a few 'non-atari' carts that are affected as well. Check the FAQ for full details.

Yes. I've yet to see the guts of a GBA but I suspect it's video subsystem and just about eveything else are consolidated into a huge ASIC or two. The battery life they get out of those things is remarkable.

> The problems with most of these video chips is that they are no longer made.
> Meaning you have to either scavange older computers/games or find a supplier
> that stil has them. How would you like it if some bozo that uses a different
> computer buys all of Best Electronics' and B&C Computervision's ANTIC's?

Grins fiendishly.

Fear not. Your ANTICs are safe from me. They shine best in an Atari. At least for now ...

Using virgin chips had never crossed my mind. What had been proposed is more a kin to grave robbing. There are plenty of discarded consoles and the like to easily satisfy the demand for video chips. Just a matter of selecting suitable donors (of which the GBA is likely not).

Don't worry about the victims. They won't be missed. It's not like there are a lot of hobby computer people around.

Of course this is all talk. Not a project of mine. Adapting something as complex as a video chip to foreign system without docs is an enormous undertaking. Not for the faint of heart.

If you're interested in redoing the Operating system, the XL and XE models
use a ROM chip that is pin-compatible with the 27128 EPROM, which is rather
convenient. A 27256 fits as well, and only requires a simple switch to
hold 2 OSes at the same time (XL and 400/800 anyone?)

Hope this is of some help,

David P.

Glad to hear that! I'm a bit sick of all those emulator related topics
:-))

: > I never use BASIC.

: Have to disagree here; a great little language and very powerful when
sprinkled
: liberally with USR() commands.

Years ago I used TurboBASIC for a while, but since I'm using Sparta-Dos I
never use it anymore. Learned myself a bit of assembler, and now I'm used
to the speed of it, so no more BASIC for me :-)

Well, I use one little BASIC-util every now and then I wrote myself. It
converts a "62-sector" MicroPainter picture to a format I can display on
small screenwidth. It does nothing then stripping bytes at the end of each
"line" and will write the smaller pic back to disk. It works. I have to
write an assembler-version of it, but the times I think about it is when in
the middle of another project (when converting a picture :-)

Hello,

The carts should run with no problems. I have really only seen one game that does not run on the XL/XE and that is "Ali Baba and the Forty Thieves". There is a XL version and I looking for that. There is a program called "The Translator" and that is suppose to turn a XL in a 400/800 computer. For the most part, I think you are safe. I own a XL, XE & a 400 and I am satisfied.

Hi Ed, you can actually use an original atari basic cart to get old disk and tape games going in an XL, If only there was a biggyback cart. My old version of Chop Suey on disk needed translator/old basic to run. I think all the translator does is load an old rev basic 1.0 or something.

Wrong, Mark;

All of the Translators (Atari A & B disk, XL Fix, Boss-XL, Omniview, etc.) altered the XL OS so that common entry points for routines like EGETCH & EOUTCH would be the same as the old 400/800 operating system. Many software developers (including some Atari employees) had made direct calls to the actual routines instead of using the vector tables at $E400-E44F which would not move with OS revision. A lot of them just disabled the XL OS ROM and loaded a 400/800 OS into the XL RAM at the same address space.

Basic was not affected by these translators. The one exception was a B to C conversion printed in Analog which copied the B Basic from XL ROM to XL RAM and then changed enough bytes to eliminate the Rev B bugs.

I think it's possible to say that all games works in Atari800 with
correct switches. Broken images doesn't.

Always try to run under OS/A, turning off SIO patch, turning off rom
patches. If exe, loading from other DOS/menu.

I believe there is already a MID to AMS converter program out there. You could probably find it using Mr. Kendricks' XL search, the link is in the FAQ.

Nope,
thats the other way around. You can convert an atari-8 AMS sound file
into an Atari ST MMS sound file with the AMS2MMS Converter... -Andreas

P.S.: Mail me, if you need some A8 sound converters or players; as
always I have collected them on a medium/dual density disk (2 sides).
here you will find: MOD players, MD8 players, MOD2MD8 converters,
MD8toCMC converter, AMS player, AMS stereo player, AMP player, various
sample players, WAV players, WAV2DIG converters, DIG players, CMc
players, Multiplayers (CMC, TMC, MPT, etc.), SVX player+converter,
AMS2AMP converters, AMS2MMS converter, etc., etc. ...

```
Here's the games on my disks :
Volume 1
Jet Boot Jack
FireFleet
Dan Strikes Back
Captain Sticky's Gold
Hyperblast

Volume 2
Jet Boot Jack
Stranded
Diamonds
Robin Hood
Citadel Warrior

Volume 3
Jet Boot Jack
Airstrike 2
Batty Builders
Breath of the Dragon
Neptune's Daughter

Volume 4
Chop Suey
Fire Chief
Kissin' Kousins
HiJack!

Volume 5
Chop Suey
Quasimodo
Mediator
Elektra Glide

Volume 6
Elektra Glide
Fort Apocalypse
Time Slip
Drelbs

Volume 7
Elektra Glide
Colossus Chess 3.0
Blue Max
Alley Cat
```

That's the ones I know, I don't know if a volume 8 ever came.

Want to buy Volume 3 if anyone got it

Take Atarian care

Now, Vidar knows what he's talking about.
But...? Just about everything has been cracked and is around, I think.
A quick check of spudster's archive (CTH archive), shows two
files. 'neptunes.com' and 'neptunesdaughter.exe'.
I guess Vidar has some uk disks that are copy protected, with
neptune's daughter as one of the games.
I don't think Chipmunk or Black Patch have those titles, or rather
the titles of the compilation disks he speaks of.
But, YES, there is a way to dump copy protected disks to copy protected
images. Namely with APE ProSystem cable. I've never used the
prosystem cable, but it is by Steve Tucker and I'm sure it works.
I sorta thought prosystem was for purists who only want the exact original
disk game, as some cracks omit opening screens and so forth.
Russg

For the sake of argument let's suppose you could design a next generation $300 homecomputer. The goal is to make a userfriendly machine for general use and for hobbyists. How would such a system look?

CPU? (P.S Intel and AMD are out, far too expensive and powerhungry for this type of thing, you should be looking at the $20-35 level)
As OS? (Linux is a dead giveaway, but there also other OS's out there)
Build in programming language? (please choose anything but Basic!)
Amount of memory? (RAM and ROM)
Graphic and Sound?
Network capabilities? (internet capable)
Plug in capabilities (remember you're making it as cheap as possible so modems, CD-Roms, HD's are all extras)
Video (TV? or Monitor?)

Remember that the RETAIL price should be $300, so think in wholesale prices. The real costs should below $200 or even below the $150 level. You may presume that a million units would be manufactured so take volume discounts for components into account

Let's see what sort of systems people come up with.

I think it's on one of the Megaimages and I can't dump them to PC, they're heavily protected. Anyone want to sell a cable that allows to copy protected disks ? Does it work ?

OK, I'll bite. How about something based on a PIC microcontroller? Something modular where when you're done programming the thing, you disconnect the keyboard, drives, and monitor and then let it do its thing controlling your lawnmower, artificial dog, home alarm system, or whatever.

all
: the translator does is load an old rev basic 1.0 or something.

No, not BASIC.
The Translator (or XL-fix, or OldRunner) loads the old Atari o.s. (Atari 400 and 800) into the newer Atari computers (Atari XL/XE). Some programmers did use direct jumps (illegal jumps) to o.s. routines in stead of using those routines the legal way (using the entry-vector of such a routine). Some routines of the 400/800 were moved in the newer XL/XE o.s. No problem when using the vectors, but some programmers thought they knew better and used the direct calls...

Yes its a game. Was advertised in the magazines. A friend claims he
has a box that says 16k Atari cartridge on it. Still no cart though.

Hi,

Nice choice the PIC but as they have little RAM of their own,
why not have a ROM containing an implementation of a
JVM which the PIC interprets, in turn taking the application
classes from another ROM (or EEPROM for ease of updating)
topped of with a SIMM or DIMM for working RAM?

Actually you may be better off with a 68000 (or derivitive)
and go along the lines of the Jump/WabaJump stuff that's
going on, however after already seeing:
http://www.uclinux.com/hand-powered_web_server/index.html
What is the world coming too!

Regards,

Mark

>type of thing, you should be looking at the $20-35 level)
Well, in quantities, you might get pretty close for low end
Celerons....
>As OS? (Linux is a dead giveaway, but there also other OS's out there)
FreeDOS?? It's getting closer to be usable everyday....
Linux for a home user, no way, not in this decade AFAIAC... ;-)))
>Build in programming language? (please choose anything but Basic!)
What's wrong with BASIC? It's easy to be "build in", as it is an
interpreter and there are a lot of BASIC variations out there that
would stand any comparison for ease of use and performance....
Or you you suggest something more academic like Smalltalk, Lisp or
Java???
>Amount of memory? (RAM and ROM)
Not as much a question of cost (128MB SDRAM is less than $10 these
days), as of a combination of the above specs...
>Graphic and Sound?
VGA style graphics with 4MB RAM and at least 800x600, 16bit colors is
not a problem these days either..
And SB compatible sound probably not...
>Network capabilities? (internet capable)
an onboard solution with a Realtek chip and TP 10/100 RJ-45
connector...
>Plug in capabilities (remember you're making it as cheap as possible so
>modems, CD-Roms, HD's are all extras)
>Video (TV? or Monitor?)
Well, a monitor is probably the most expensive part. As for the
possible graphics capabilities, a TV (if it's not a fancy digital HDTV
one) is far below the capablities of the graphics chips...
>The real costs should below $200 or even below the $150 level. You may
>presume that a million units would be manufactured so take volume discounts
>for components into account
If you buy a million pieces of ANY component, you get FAR below the
usual retail prices. a quick look on pricewatch reveals

CPU: AMD Duron 700Mhz $24 (Celeron 700MHz $42, VIA Cyrix 700 $37)
Memory: 128MB PC133 $9
Mobo: Intel 810 $38 (build-in video!, USB, keyboard,...)
case w/ p/s $25 (ATX desktop)

Ok, that is a pretty mix, bu assuming large quantities as you
mentioned, this is less than $100 for the major parts. Add a few $10
for network and sound and smaller stuff, no problem...

>
>Let's see what sort of systems people come up with.
>
Ok, just a rough sketch, but it should give you an idea.
The problem is to finance this and to get the software for it (BeOS
might be nice, but....)
And these days, you will have a hard time selling something that is
not Playstation or PC compatible...
And than you are up against M$ with their XBox or whatever it is
called these days......

just my 2c,

Ralf

You need to make your mind up. Either it's a toy - and at $300 retail
that's all you can aim for - or it's a computer for "general use and
for hobbyists".

>CPU? (P.S Intel and AMD are out, far too expensive and powerhungry for this
>type of thing, you should be looking at the $20-35 level)

Very cheap and weak Intel or AMD CPU's then. The alternative is to go
with the stuff used in PDA's, but do you want to have a desktop or a
PDA.

>As OS? (Linux is a dead giveaway, but there also other OS's out there)

Like QNX maybe, or a ported version of AmigaOS. Other alternatives
rake you back to the PDAs.

>Build in programming language? (please choose anything but Basic!)

gcc for real programming, Perl for scripting.

>Amount of memory? (RAM and ROM)

Depends on the OS. No ROMs, they stink.

>Graphic and Sound?

There are plenty of cheap chipsets.

>Network capabilities? (internet capable)

Built-in 10/100 BaseT. Essential.

>Plug in capabilities (remember you're making it as cheap as possible so
>modems, CD-Roms, HD's are all extras)

Don't be daft. There's no point making CDROMs and HD's "extras".
What, you think people are willing to go back to swapping floppies?

>Video (TV? or Monitor?)

Again, are you after a computer or a toy?

>Remember that the RETAIL price should be $300, so think in wholesale prices.
>The real costs should below $200 or even below the $150 level. You may
>presume that a million units would be manufactured so take volume discounts
>for components into account
>
>Let's see what sort of systems people come up with.

What's the point? This is market research for the '80s. Nowadays
people aren't satisfied with a cheap jack of all trades that doesn't
do anything very well. They want a cheap games machine, they buy a
console. They want a cheap general purpose computer, they get one.
They want something cheap that does everything well, they get into a
time capsule and go back to 1985.

Anyone aiming to produce computers that retail at $300 is going to be
peddling a pile of camel dung.

A good idea. If someone has them they will more likely email to brag
about it if they are "downgraded" in the listing.

> Never released carts:
> Sierra On-Line Jawbreaker NR
Tend to think a few exist. See my other post.

> VisiCorp VisiCalc NR
Probably can remove entirely. Was just confused with the Mexican
title.

> Regarding a discussion on Da'Fuzz, I was sent scans of this cart a while back.
> I will see if I can dig them up.
Please do, Would like to see them.

I couple of questions about others:

Atari Inc ?79 BASIC Computing Language
At most, this is a label variation. There are only 3 Basic revs and
they are elsewhere in the list. Suspect that it is a white paper
label you sometimes find on Atari carts. Probably used by service
centers and vendors.

Reston Movie Maker
Advertised in 1984 (during the crash) as "coming soon". Undoubtedly
some beta exists. Has anyone sent in a cart scan ?

I do have cracked files of most of the games, but the collection as a whole disk, I don't have. I cracked some games way back too, but never managed those and Alternate Reality. Those were pretty hard. I didn't try to long on the English Software collections, as I had them on files too. But, I didn't want to destroy my AR disks and wanted a copy. Damn, it was programming itself while loading and stuff. I think it unpacks parts of the game and adds or subtracts values to it, so that what you saw in a disk editor was utter garbage. Really good coders Price and Gilbertson.

And the Volume 3 disk, someone must have forgotten to deliver them back waaay back and I can't figure out who. Really would want it to complete (I think) the collection of the Smash Hits.

Take Atarian care

<snip>

Two points.

Firstly, what's so bad about Basic? It's entirely possible to write structured programs in any decent dialect (BBC Basic being a case in point), and the mere posession of a GOTO statement is not in itself the mark of the devil.

Secondly, why does there have to be only one built in language? Look at the BBC Micro - 4 ROM sockets (expandable to 16), allowing you to have several languages resident at once, switchable by software commands (eg *BASIC or *PASCAL).

[1] Yes, I do own one, and it's great.

OK I dont speak Dutch or German.. what is it they, sell just the pens? I have the whole unit and I have seen them go for around the same price on ebay before. Granted ebay can hike the prices due to the auction status. Any idea on what I can get for the unit?

Kind of off topic here, but didn't one of the historical sites have the
schematics for the various LSI chips in the Atari?? I seem to remember a
thread a while back about them being on someones site...

they were the internal circuitry for the LSIs

All that, "The FIXXL", "The Translator", and "Ultimate OS", do are to flip on the "RAM under ROM" memory latch of the XL/XE, and then load the old OS/A or OS/B operating system ROM images into the now available RAM space. I do not think that these programs can be used with SpartaDOS, as SpartaDOS uses RAM under ROM scratch space. Neither can they be used with Turbo BASIC, which also uses this space. However, they can be used with FrOst BASIC, the ATARI 800 precursor to Turbo BASIC. For playing a game they should be fine, though.

>

It would probably look very much like the e--Machines system I just
bought my daughter to take to college with her.

600Mhz Celeron
32 MB RAM
8Mb SVGA Video integrated on motherboard
Soundblaster compatible integrated on motherboard
10 GB Hard Drive
16x DVD
Keyboard
Mouse

Cost? $269

(OK, I got a deal because these were "returned" systems from a company
that canceled a contract. They had to be sold as :"ref urbs" because
they weren't "new". Big deal.)

Oh, and I added a 10/100 card for $14 and 256MB RAM for $55

She probably could have gotten by without the RAM, but why?

The price is in the $300 ball park and it's a system she'll be
familiar with and can make instant use of. The software it runs will
be compatible with most people she runs into in college. It has a
software base that no new computer could challenge for decades.

>CPU? (P.S Intel and AMD are out, far too expensive and powerhungry for this
>type of thing, you should be looking at the $20-35 level)

And looking at incompatibilities? Let's choose something no one else
runs at present just to be different? Something with no software
base? Something that will have to run an emulator (and slow it down)
in order to have any programs to run?

>As OS? (Linux is a dead giveaway, but there also other OS's out there)

Gak. You said "userfriendly" up there. Linux is out. Waayyyy out.

>Build in programming language? (please choose anything but Basic!)

Why not? BASIC is userfriendly. It uses natural language. It was
designed to be easily usable.by anyone.

Why choose something that will only discourage users from learning it?

>Amount of memory? (RAM and ROM)

RAM is cheap. More is better. Decide on the actual amount at the
last minute depending on the final cost of the unit. Put in as much as
you can to bring the cost up to your final limit.

ROM is nice, but restrictive. Atari was hobbled by the difficulty of
releasing bug fixes to its TOS operating system because the OS was in
ROM. (Well, that was one of the reasons.) But it was VERY nice to
have the system boot in seconds.

>Graphic and Sound?

Yes, definitely.

>Network capabilities? (internet capable)

Of course.

>Plug in capabilities (remember you're making it as cheap as possible so
>modems, CD-Roms, HD's are all extras)

Why? When you can buy a system like I described above. Who is going
to buy a stripped down box? Will it have a cassette interface?

>Video (TV? or Monitor?)

Using a TV will restrict the output to 40 columns. Nice if you're
currently using a VIC-20, but who is going to do anything but play
8-bit games on a TV?

>
>

Well, I've already got mine. (I'm designing roller coaster tracks
on it right now. I'll probably take that off before it goes off to
college with my daughter though.)

hmmm... I think "Next Generation" and "$300 Home computer" are diabolically opposed.

> CPU? (P.S Intel and AMD are out, far too expensive and powerhungry for this
> type of thing, you should be looking at the $20-35 level)

AMD Duron 700MHz, 24 bucks. Powerhungry? who cares, I have a wall socket.

> As OS? (Linux is a dead giveaway, but there also other OS's out there)

Optional, included OS's are evil.

> Build in programming language? (please choose anything but Basic!)

"Next Generation" and "built - in" are diabolically opposed, why plan for obsolescence? (and what's wrong with Basic?)

> Amount of memory? (RAM and ROM)

256MB PC133CAS2, a whopping $50. To hell with ROM, ROM only seals the fate of the shortsighted. Anything "Next Generation" should have no ROM, hell, even the BIOS is going the way of the dodo.

> Graphic and Sound?

um, yes. ;)

> Network capabilities? (internet capable)

yes.

> Plug in capabilities (remember you're making it as cheap as possible so
> modems, CD-Roms, HD's are all extras)

It's cheaper if they're NOT extra's.

> Video (TV? or Monitor?)

Grown men don't find sitting indian style on the floor in front of the family TV acceptable. Monitor, please.

> Remember that the RETAIL price should be $300, so think in wholesale prices.
> The real costs should below $200 or even below the $150 level. You may
> presume that a million units would be manufactured so take volume discounts
> for components into account

Why $300? If I want "Next Generation", I'm ready to pay for it. I'd rather pay $3G for a useable PC than waste $300 on something crippled to "cut corners" that doesn't do what I want. Money is /hardly/ an entry barrier these days.

> Let's see what sort of systems people come up with.

While interesting, the "Next Generation" PC will hardly be revolutionary because of its hardware or its cost. Both those barriers are /hardly/ barriers any more. The area society would most benefit is computer science research, Operating Systems and User Interface design are what will make something "Next Generation", not cheap hardware or retail price.

It should be small and cost-effecient. $300 is WAY too much. let's say
$150 is quite affordable. Also it should be able to emulate numerous of
those old home machines and the emulation be changed in software.
Nowadays it is possible to make chips by programming them.

> CPU? (P.S Intel and AMD are out, far too expensive and powerhungry for this
> type of thing, you should be looking at the $20-35 level)

> Video (TV? or Monitor?)

Cpu would be Western Desing Center 65816 and a z280 or a z380. Both
would share the same memory, and there would be 16 megabytes of ram
memory and bankable one megabyte of video memory (so that it can be
mapped to either cpu's memory area). Also they could run their code
simultaneously so that when the machine is emulating a 65xx machine, the
z380 emulates the old chips in those systems while the 65816 runs the
code. Also, when a z80 machine is emulated, the 65816 takes care of
chipemulation. Also some of the memory would be relocatable in software
so that the old chips, roms and so on can be easily emulated. The clock
speed of both cpus should also be changable in software.

The programming language would be c++ or c or assembler. Also basic
would be considerable. Only needed rom would be the code starter roms
for both cpu's and a boot rom. The rest could be loaded from an ordinary
ide hard disk drive. A dvd-rom would also be a good there; it can store
much information and can possibly be used to watch dvd. Also if it is
made bootable it would be fine.

As a graphic solution a svga driver chip would be superior. As a sound
chip a creative sb16 chip would be fine. It has fm and 16 bit stereo
dsp. A ne2k compatible rtl8019 would be fine for networks.

I remember I had a game that I downloaded from a BBS called "Pleasure" that sounds a lot like what you mentioned... It's a totally sick, tasteless, and offensive text-based game whose goals include rape, abuse, drug use, and sexual intercourse with babies (no kidding)... It had no pictures (except for an occasion ASCII drawing) but it was still very graphic in its descriptions, and I remember being shocked by it as I was only 12 or so when I played it... I downloaded a huge ZIP of ATR files, and this was on there, only it was edited so it didn't include those more offensive details (or maybe the version I had was added on to?)

I think this game was written in some Adventure-Maker type program, because of its interface, and it has no author/company/date information anywhere....

Wow, what a great game! Great graphics, unforgettable soundtrack, and a genuinely eerie atmosphere. Are there any fans of this game out there?

However, whenever I got to Side 2 of the disk the graphics would stop showing up and I'd have to rely entirely on the extremely limited text descriptions (sometimes the pictures were required to see what was going on). I got several copies from different sources, and they all did the same thing... Is this a problem with the software/programming or was it likely that my 130xe couldn't handle it for some reason? I know pictures from the latter half existed, because they showed screenshots of them in the game's manual... Anybody else have this problem with that game?

Paperweight scared the living shit out of me as a teenager. As it went through it's routine I could feel my face flush and my heart race and I remember vividly thinking "dad's gonna f**king KILL me for wrecking his computer!". When I realized it was a joke I was steaming mad and wanted to kill its author...

Looking back, it was a really nicely-done, innovative program... You didn't see too many "prank" programs like that back then...

First of all, it would be two different systems:

A "userfriendly machine for general use" could very well be a closed
machine, like e.g. the early Macintosh models. The user just wants to
use such a machine, without caring about the inner workings of it,
much like you e.g. watch TV without bothering to understand how the
TV set actually works.

A machine "for hobbyists" would be different: it would be open, well
documented, expandable, etc -- more along the line of the Apple II or
the PC's. This machine is for people who want to poke around in it.

(with apologies for the huge cut and past of one of my previous posts)
CMD made an attempt with GUS - 3 x 65816 at 20Mhz, SCPU 128 architecture and some other neat ideas. The arrival of cheap PCs killed the project. The problem with cheap PCs is that their first-time owners tend to treat it as an appliance, and paying expensive bills to get problems fixed, or to purchase entirely unnecessary application software for more than the initial purchase price of the box.

One of my favourite "toys" was an old Dick Smith (Funway?) Electronics Learning Kit. It was a board with springs (to join the hookup wire), components, and project sheets. Simple, fun, and educational. Especially since there was no need for that ten-year old to to wield a dangerous soldering iron and play with mains electricity. Which leads nicely into...

If the C64 was going to be ressurected in a modern form, it would have to be something entirely different from a PC, and aimed at an entirely different market. A "learning" or "hobby" computer. Like "Mecchano" and IIRC "Lego Robotics".

Something that was:

a) Relatively inexpensive
b) Programmable
c) Childproof and newcomputerowner-proof
d) Expandable

What I'm thinking of is a SCPU-driven 64 in a PC mini tower, with real O/S that sits over the C64 BASIC/KERNAL package and provides a protected environment for a new BASIC or PASCAL with strong visual and audio support. A component system, similar to Borland's "Delphi" would be really nice.

The O/S would be scaleable -
* A "Childrens' Mode" which allows a subset of the programming languages and lots of presets for stuff like printer output, menu-driven educational titles, etc (in ROM?). Perhaps a point-and-click programming language with built-in music to make "games" similar to the old Commodore "babysitter" titles ala "Pinball Construction Set".
* A "Hobby Mode", perhaps using a hard-to-get-at hardware switch which allows access to the guts of the machine, and 64-mode, etc. A redesigned "hobby-port", basically the User port with build-in relays and perhaps a bay for a 9-volt battery to power plug-in (out of the box) hardware projects.

In all, a machine that the user can get a real feeling of being in control - no worry about viruses or crashes or constant version updates and patches. Something parents will buy for the kids as a toy but may (hopefully) discover than by plugging some extra stuff into it, can do basic tasks like wordprocessing and may not be quite the toy they thought it was.

An internet project already exists for a "Next Generation" CPC computer, which will use an eZ80 processor (Z80 compatible), run old CPC software, be open, have a new operating system etc. See web page at http://cpcng.free.fr/ or mailing list archives at http://groups.yahoo.com/group/CPCNG (a bit quiet recently).

A PowerQUICC 862 (I'm not sure I've got the number right)
> As OS? (Linux is a dead giveaway, but there also other OS's out there)
go for linbux, it's easiest.
> Build in programming language? (please choose anything but Basic!)
why bother, just stash gcc on it's HDD
> Amount of memory? (RAM and ROM)
dunno, the stuff's dirt cheap, prolly somewhere around 32MB.
> Graphic and Sound?
Half inch a cheapo PCI SVGA chip and stick an AC97 codec on one of the PowerQUICCs serial ports.
> Network capabilities? (internet capable)
Make use of another PowerQUICC serial port.
> Plug in capabilities (remember you're making it as cheap as possible so
> modems, CD-Roms, HD's are all extras)
SCSI and USB. I would *not* make an HDD an extra. They're cheap enough anyway, for a small one.
> Video (TV? or Monitor?)
Both standards, but supply neither.

No, they're cheaper these days.

What with them being a lot smaller, efficient, cheaper to produce, etc.

And I'm surround by two MIPS boxes (One is admittedly a PSone, the other is
significantly cooler - an SGI Indy), one SPARC box (SPARCstation IPX) and one
SuperSPARC box (SPARCserver 10).

These might not be be spanking new architectures, but they're superior in
every way (expect sheer clock speed) than any Intel/clone box I've seen.

>Weird. I think you should check out a recent Linux distribution.

I've been using and sysadminning Linux for the past few years, and
none of the distributions I've tried have been sufficiently
idiot-proof to put in a consumer device*. However, that doesn't mean
that one couldn't be created.

Now that I've been using it for a couple of weeks, this 'ere Debian
box behaves perfectly. I can and do use it as an appliance sometimes,
and at other times - well, there's all the other goodies there so I
can hack away.

I turn it on, and, after a minute or so, I'm at a graphical login. I
log in and I have a desktop, with common applications already on the
desktop and less-common applications in a small drop-down menu. The
Gnome panel across the top has a clock, a battery meter, and a
shutdown button, (and cos I'm somewhat more of a 'power user' than
what we're targetting, it has virtual desktops, task lists, etc as
well). It all 'just works'. And because the important config files
are protected, dumb users can't just break it. I have to explicitly
make myself root to break it.

* - nor is Windows. How many consumer devices do you have to go
through umpteen arcane menus and options to do something trivial? Not
even my VCR is as badly designed as Windows.

4237. Is there emulator to format a image?

Newsgroup: comp.sys.atari.8bit
Date: 2001-07-13 19:28:19 UTC
From: Russ Gilbert <russg@en.com>
Message-ID: <3b4f8269$0$14442$4c5ecdc7@news.erinet.com>
Source record: 35570

I tried xlit, atari800dos, atari800win 2.5c. MyDOS45, Sparta 3.2a.
None will format a 720k blank image produced with APE 1.16.
Can any emulator format a 720k image? or any image for that matter?
Or do I have to have a real A8 to format the image?
Just a side note. I tried APE 1.16 unregistered today to do some stuff
and basically it won't write using SpartaDOS. Any effort to write
with the unregistered and SpDOS fails, I'm pretty sure. I knew the
unregistered won't write to PC Mirror, that's in the documentation.
Writes with MyDOS 4.5 are ok. My registered 1.17 will do fine
writing with SpDOS.

Source record: 35561

I have the following 2 Atari 8-bit cartridges:

1. Bounty Bob Strikes Back (very rare!)

2. Miner 20-40-9er.

Both cartridges work fine. Bounty Bob is in almost perfect condition, with the exception of the very top part of the cartridge having normal wear on it (probably from pushing it in/out of the cartridge slot).

Miner 20-40-9er is in blah condition - its got a pretty good scratch on the back of the label, but the cartridge works fine.

I am selling both of the cartridges together to the highest bidder. If anybody has any interest in these Atari 8-bit cartridges, please send me an email message with your very best offer. I checked on Ebay and they are selling for a LOT of money. If I can get something close to what they sell on Ebay for, I will bypass Ebay and save the few pennies on commission.

Please email me with your BEST offer at: puzzele@att.net

NOTE: ONLY serious inquiries please. Thanks in advance.
I anticipate putting it up for auction in the next few days.

Interesting, I had a similar kit with a board, springs, components and project sheets. You could upgrade the entire board to a full experimental control system complete with well written manuals (even for a kid) how to build and design assorted circuits. Cool stuff. :-)
You could find them in some of the larger electronics stores but I haven't seen one in years (sigh). I don't remember the name but it came from a german company, the boxes they came in were orange with electronics and schematics on them.

The reason is that Basic will being a good language for beginners isn't the best language to learn the art of programming (structure, modules etc..) . I'm not up to date up to date on recent Basic dialects but I believe the same problem still applies. Once you get to the higher programming languages this becomes evident and you have to 'unlearn' before you can start again.

Don't get me wrong. Basic was a good beginners language but these days I think Python is far more suited for newbies and novices.

If it has a network interface you could use an external server for storage.
No need for floppy's, CD/DVD's then. You could register for this service at

the time of purchase. Maybe they could also include some open source
solution for people who want to run their own server at home.

That's simply projecting the current situation into the future (and the past
for that matter).

As for a cheap games machine. Remember it ain't the cheap hardware that
evaporates your bankaccount, it's the software. If we're good honest
corporate citizens ;-)

What you're referring is an 'Uber-Console' given processor power, dedicated chips and proper emulators you could do that. But I'm afraid the $300 barrier would be broken if you include recent formats. For such a system to be legal (software piracy) a HD storage wouldn't be advisable. Instead it would have to support the various CD-formats, cartridge slots etc...straight out of the box.

It's possible i suppose but the price would be far above $300.

Cheers,

Thomas

I've tested various distro's and for the moment Suse 7.2 comes close to your ideal. The graphical setup interface is top notch. You do need a decent system to run it though, but there are plenty of other distro's for lower end systems out there. The SuSE 7.2 evaluation can be completely run from CD-ROM with some settings and some memory swap space (not necassary if you +170MB RAM) stored on your HD. This distro really is plug and play. It can detect most of the components (sound, network, video, modem etc..) and set them up correctly. If your card isn't detected automatically you just select it from the list. (I had to select my old SB16 ISA card this way) and just fill in the settings for FM, MIDI, IRQ that sort of thing.

In the end you get a perfect configured Linux system thats idiot proof. No hassle, no danger of messing up your HD. Just boot the CD for a test run. Try downloading a version to see for yourself from www.suse.com

I've been experimenting with Linux for two years now and SuSE 7.2 (and Mandrake?) is the best idiot proof version I've seen. Anyone reading should try it, it's that good.

Cheers,

Thomas

Atariland has free email, but you have to sign up with their site. I
still haven't figured out the need for signing up- you don't get spammed
or anything. I can't remember the link but a simple search should point
the way to Atariland....

Whoops! Actually, I'm thinking of SHADOW WORLD (also Synapse I think?). I have DRELBS on the same disk, so I must have got them mixed up... But all I get when I load DRELBS is a blank black screen... I'll have to get a copy for the emulator and see what it looks like.

Yeah, I had Erotica-X too now that you mention it. That game had a brilliant storyline (although was needlessly difficult at times)... I liked the bizarre, sci-fi ending. Someone should make a movie out of that game!

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

OTHER USENET NEWSGROUPS:

No, it doesn't... As mentioned previously, BBC BASIC had procedure and function definition... QL SUPERBASIC went one further and the procedures/functions actually defined new keywords... It also had Repeat loops and such. It was quite possible to dispense with GOTO altogether. (And this was in 1983)

Hell, even C has GOTO... It's just that its use is frowned upon to the point of flogging.
:)

Besides that, a computer without a ROM is just a dead hunk of silicon.
Fine, the CPU will work, the memory will work, but without a little peice of
code in ROM to tell it what to do at power on, where does it get the
instructions to deal with the network or hard drive?

Does this person think the hard drive just automatically squirts data into
the CPU without any instructions from the CPU whatsoever?

Well, than you have never used a real good BASIC interpreter/compiler.
A lot of "old" Business BASIC versions are not much different than
more modern HLL. And even the BASIC used in machines like
Amstrad/Scneider or the good old BBC were a different ball game too.
Not to mention HP "Rocky Mountain BASIC" for technical apps....
Don't just think the crappy C64 basic or stuff like this... ;-)))

ok, but i also mentioned that in quantities you get probably prices

below what i mentioned from a general wholesales web site above.
>costs and the basic essentials (special casing (not just a standard box),
>cooling, cables etc...). These things eat into margins.
Well, not much cables in a modern computer, ok add another $2 and
maybe $5 for keyboard and mouse. As for materials to build it, you are
still way below $100.

There will be additional overhead, like labor, shipping and
advertising, for which i would assume even more money than the actual
labor to build it.

But the biggest catch would be to get the start with several million $
financed first, without knowing IF such a product would actually
sell...
Well, i don't have that much money to gamble with, and if i would, i
would rather lay somewhere the the tropical sun than writeing these
lines ;-)))

4261. Newbie programming computer - Was Re: If you could design a $300 homecomputer

Newsgroup: comp.sys.atari.8bit
Date: 2001-07-14 22:10:47 UTC
From: Corbulo <corbulo@mind_ATARI_spring.com>
Message-ID: <B7763BA6.4ECE%corbulo@mind_ATARI_spring.com>
Source record: 35584

Sort of off topic, sort of not.
I was reading an Atari BASIC book the other day and realized that the average computer user today, in general, has absolutely no concept of programming. And most computes today, in general, do not even come with any type of programming language to even start with.
Windows has never been consumer programming friendly, it has not shipped with any type of BASIC (yes, I know BASIC did exist on the drive, but it was really only there so the Edit program would run. MS heavily discouraged its use.)
Macs are the same way. Linux is the only consumer available platform that has programming, and imo it is a stretch calling it consumer, lets borrow a camera industry term and use "prosumer". And Linux easy to learn? Lets not kid ourselves. Maybe someday, maybe soon, but not now.

So the real point here is this,
Was the only reason that BASIC a real part of home computers for years, a requirement because us prosumer hobbyists demanded it?
And then when sales to us tapered off and sales to the consumer increased, did it fade away because the general non-hobbyist consumer did not want to learn to program and the machine itself?

I think if we could answer this question we could answer a lot of other questions. (i.e. "Is there any money in an alternative low-cost computer.")

Unfortunately, imo, the answer is out there for us.
Several items to consider, the death (still-born) of the Internet Appliance.
The slowing of the PC industry in general, even at the low end where some predicted growth forever. (ex. eMachines and others in trouble)
And I remember a while back, some Scandinavian country company bought the rights to the C=64 and was going to turn it in the exactly the machine under discussion here.
AFAIK, it never made it past the "Who would buy that?" stage.
Consumers are a _very_ fickle and vindictive lot.

I personally think that an Atari 8bit, drive and printer for less than $100 would be a great fit for any family today. Not to compete with the Playstation2, but to complement it.
Wouldn't sell a single one and wouldn't make a dime.

I could go on for hours, but then who am _I_ kidding?
No-one really cares anyway! :)
Fun to talk about though.

Corbulo

Actually I think it may already have been done. A group of scientists in
India have developed the prototype for a $300 computer for the masses.
Although recently a separate story proposed for India modern playstation 2
or Xbox as the basis for such a computer.
I think the current Shift magazine mentions the cheap computer prototype.
No idea what its features are.

You are absolutely correct, I listen to people everyday talking about how they are going to go to school and study computer programming. When I ask them what type or language- they all say the same thing- "Oh I don't know maybe HTML or JAVA, you know web page design". I can't help but laugh, I realize that there is a market for that, but it is not what I would call computer programming, more like yuppie programming. I ask if they've ever tried BASIC and I always get a "What's BASIC?". If you are a real guru, Microsoft was kind enough to leave Debug in MSDOS, but it's a far cry from BASIC. I think it was probably about the time that they started marketing Visual Basic for hundreds of dollars that they cut off the supply of free basic.

Hey, lots of us care, but unfortunately I must totally agree with you about the A8. It harkens back to the days when a much larger fraction of users developed their own applications; I still use it on tasks for which a ready made M$ title does not exist.

4269. Question about max speed

Newsgroup: comp.sys.atari.8bit
Date: 2001-07-15 03:01:04 UTC
From: tony rudzki <arudzki@bellatlantic.net>
Message-ID: <QH747.5622$I%.3193197@typhoon2.gnilink.net>
Source record: 35592

OK, I have a question, hypothetical of course.

This is for all the hardware gurus out there.

The chipset operates off of the color burst frequency of an NTSC signal right? or some division of it (1/2?)

Now, if the chip set uses DMA to get their data from RAM and do it by halting the 6502, why can't the processor be sped up on a new crystal at a multiple of the same clock?? In other words, if I had a 6502 running at 7.16 (4X faster than now), would it matter if I divided that clock down 4x and fed that to the graphics chips??

Don't know the seller, but it looks good. Actually I thought the
seller had setup the auction badly. A minimum of $1000 with a reserve
of $1200? A lower minimum would get a lost of bids and build up some
excitement. Might consider some kind of escrow service if you bid.

Gene

I, not a company or else, can by a 700mhz AMD processor for 24$.
That doesn't seem 'far too expensive' to me. Those processor rocks!

> As OS? (Linux is a dead giveaway, but there also other OS's out there)

Linux, why not. .. oh yea. You mentioned userfriendly. so thats a nono.

> Build in programming language? (please choose anything but Basic!)

Built in? Are you think stuff like in the 70's? Or you really want to put a C++ compiler in rom?!?!?

> Amount of memory? (RAM and ROM)

256meg RAM. 8K EPROM

> Graphic and Sound?

Geforce2

Basically said - yes !
But the processor also acesses all peripherial chips in the normal
adressroom. And these are not fast enough. So you have to slow down
these accesses - not as simple as it sounds like.

Look at the web for the description of "Hyper-XE" by Mario Trams. Even
if it is a 65816 expansion to the Atari XE, all the facts are described
very well.

Matt

Personally I'd like to go for £400 to allow for inflation (my a1200 cost me £330 in 94'), but for the sake of arguement I'll stick to the 300.
OS: QNX other than NASA no body seems to have picked it up as a serous concern, so they maybe more acceptive as a partner in the project.
Proccessor: Probebly a Strong ARM or similiar, they seem very light weight and shouldn't cause over heating, either that or a Hitachi proccessor 1 step up from that of the dreamcast should be ok.
Graphics: I'll got out on limb here and say the ati128 as it is happy in both TV and monitor setups.
Sound etc: a cheap media proccessor, allows plenty of playing about by hobbyists so should be good enough.
Media/storage: some sort of CDrom and a 4 to 8 gig HD depending on whats cheapist.
Memorey: probebly ddr as its not that much more expensive than standard sdram and I'm not convinced that sdram will be around for much longer. Also allows better perfomance for the graphics and media.
ports: 4 usb, 1 network connection
Ideally you want all this on one mircoatx compatible board in a dvd/vcr style box, this way you can refit it in a tower case if you so wish.
keyboard and mouse.
no tv or monitor, buy your own you cheap skate I had to in 94' why should I give you one now :P

I don't think so. Maybe for around $600 you could
do that. What world do you come from anyway. The
gigahertz processors cost over $1000 in the store in
a built system. The processor alone would cost a couple
hundred retail.

Maybe not as off topic as you think.

When i was buying my first computer (a sinclair spectrum BTW) there was a lot of emphasis on the educational nature of computers. To be considered 'computer literate' you had to know basic, to be a guru's guru you had to know CP/M. The creat your own programs emphasis was very strong in marketing over here. Its what helped persuade our parents hand over not inconsiderable sums of cash for the computers and periferals. For excample, The Commodore 64 was about £200, the Spectrum £130, the Atari was about £270 and the BBC was £299. Back in the early 80's a fantastic amount of cash for you average family to shell out. Games were about £6-8 and very best could claim a price of £9.99, significantly more than the £7 of a new LP in those days (hands up who remembers those!). Chances were how much your parents earned was the indicator of what machine you owned and vice-versa. Of course we never let our parents understand that it really was about games, they would stop funding our games machines then wouldn't they :0)

The last time i played with basic was in my first year at university (windows 3.1 days) and to be blunt if the quality of preperation by the lecturing staff was anything to go by, i'm not supprised its no longer taught at schools. Little stupid things like page indexes in recomended texts not matching the page count (which for that level of education, catering for the newbie to intermediate level is quiet frankly pethetic) giving the whole impression that the whole thing was thrown together in order to make up the courses. I found the 'computer use in History' course much more of use post uni (databases, data crunching and analysis, basic statistical analysis etc, using real data).

As to your idea of a supplemental machine, there seem to be some on the market under the guise or 'pre-school computers' and the like. I understand some are based on the apple 2 architecture, and can even be plugged into the TV for a full colour picture and have floppy drives. Now if some one where build an Atari 8 bit compatable machine with a 3 1/2 inch floppy drive with dos compatability, the standard cartridge slot (most use cartridges for their apps, why change something thats already there?) loads of memeory, A built in but switch offable Gui and software(like a MS works compatable suite. education applications for school again) i would certainly buy it.

Hadn't heard of that. I wonder if they are available in the US? And I wonder
how Apple compatible? (Arrgh, No! I am not going to hack on more machines. I
am not...)

> Now if some one where
> build an Atari 8 bit compatable machine with a 3 1/2 inch floppy drive with

Now take that thought and remove all Microsoft references from it. I know
it's hard, but just think of only what the "output" must be, not the method.
Ok, here we go.
Word processing. It must easily output quality documents.
Graphics. The graphical display must be able to pleasingly show the
appropriate images.
Number crunching. Spreadsheets and financial calculations must be easy to
create and accurate.
Education. Learning tools have to get and hold the attention of the student
while imparting the required information.
Programmability. Must be easy to create and manipulate programs and their
data.
Hardware. Components required should be varied, inexpensive and easy to
attach.

You get the drift.
No where in there was the mention of MS Word compatible, Excel compatible,
Intel, etc. Also, no Atari, Commodore, Amstrad, Macintosh, Linux, etc. And
no CD-ROM, no 3D, no 5 point stereo, etc.

Although I gravitate toward Atari's (I have 8), I own 7 TI-99's, I'm typing
this on one of my 4 Macintoshes, my home network has 4 Win2k servers, 1 NT4
server, 1 Linux server and and I make my living as a Network Engineer
supporting enterprise wide Microsoft Windows 2000 and UNIX systems for my

company, I don't care about the method. I just want the result.

Some people might consider the above blasphemous, but when you really get down to it, will an Atari 800 create a document as good as Microsoft Word? No, but in many cases, close enough. Will an Atari 800 teach you more about how a computer works, and how to program, say, BASIC? Absolutely!

Does the average consumer _need_ the power of a Pentium4 1.4gig running Windows XP? Absolutely positively not. Never. Ever. (And no despite what the commercials say, the Intel Pentium will not make your Internet faster. sigh.)
Will the Atari 800 play Unreal Tournament? um. Yeah, right. But then that's what I have a PS2 for.

Rambling again.
If you've noticed, I feel greatly about this topic.

I dont think you can build a 1gig p3 system for 300$ even if you play with rebates and get alot of the compnant for near free.
Your best bet is with a 700mhz AMD. <300$ will get you the MB (100BT ethernet, 3d audio, 2d/3d 128bit video, usb, etc, etc..) <70$,
700mhz processor <25$, 10gig HD ~70$, 256meg PC133 <25$, case/250W & keyboard/mouse/speakers ~40$, floppy/CD would be
under 50$. So like 280$ in single quantity shopping online.
Contrary to people beleif its not hard for MS or Sony to build 300$ console and actualy make some money on that initiale sale.

I personaly think a 700mhz duron kick any other processor even half its price. How much for a 14mhz 68020ec?
You are probably better off running UAE on this sub 300$ system then on a basic a1200.

The problem is with the apps and general UI system.
Dont know if its still the case, but getting to use an app,
was getting to know the programmer mind under unix for each and every app.
With OSX if you learn how to open a file in one app, great chances more then
that app will use that method.
I overhead people today in a store discovering why they PC with one click cd burning
was not working... they put the original cd in the CDRW and the blank in the DVD player.
Under linux it doesn't take much to have mass user be lost to the point that they need
human assistance. Would you be ready so offer this support to millions ?

Having a user friendly OS is more then having a tweaked kernal on a CD.

I think the seller did a good job of a "setup". No other auctions, no other feedback. Until I see otherwise, I will assume it is just another variance on the "1450XL" auctions that take place on eBay every few months w/o anything changing hands but hard feelings.

This is simply Microsoft inspired FUD from someone who hasn't used a
modern Linux distro. Try SuSE 7.2 or Mandrake 8.0 before spewing more
of this propaganda.

The scary part is that this would be trivial to do these days. If the
self-initialization procedure of the Busmaster-DMA IDE controller
simply included a "read one block from the disk into memory location
0" phase, you wouldn't really need any ROM. Just keep the CPU reset
line active until the IDE controller is done. Not that I'd want such a
system --- I don't like the idea of catastrophic hard drive failure in
the first place, but this would give a whole new meaning to the term....

Until those newbies start wondering why their programs don't work, and
it turns out to be because they typed the wrong number of spaces, or
confused a tab for some spaces or vice versa.

Python is a rather nice language, but requires a newbie-unfriendly
editor like emacs to keep the programmer sane.

How about Ruby?

Good DVD support? Easy to interface with 1394/DV products? Good set of USB drivers
for scanners/digital imaging? ... Easy to setup internet sharing? SSE/3dnow! Optmized
codecs?
Easy to use 'packet cd' support? How about Video IO, easy to setup & use?

If you tell me this stuff is handled better by the SuSE distribution then Windows XP I will
probably switch my home OS to linux. But other wise I wont take an afternoon to downgrade
my home OS.

If I cant use, or need to download beta driver/recompile the OS, etc... for any of my
peripherial
because the OS dont offer services/drivers I do see a problem using it for a mainstream
home OS.
Do you think linux is not on everyone computer because of marketing only?!?!?

Stephan

It is? Compare and contrast the sales of those silly 'my first
computer' things, PC/Mac-based educational software, and even a
poor-selling console like the Dreamcast.

For sale or trade:

CSS Multiplexor with ROMS, 4 slave cartridges and 1 master cartridge & documentation.

This device allowed you to run one 8bit Atari (800xl or 130xe) with all peripherals (printer, hard drive, floppy, etc.) and have multiple slave systems share those devices.

Excellent for running a bulletin board or system that requires multiple 8bit Atari systems.

Will consider trades for the following items:
RTime8 cart, 256k MIO (or better), 135mb Syquest cartridges, External hard drive (30gb range) or other interesting items.

Send email to: utah_lanman@NOSPAM@yahoo.com (remote @NOSPAM).

Hmmm ... I don't think that any of these groups are the right place
for advocating any particular Linux distribution over another. Some
of them are, of course, the right place to maintain that the Amstrad
roXX0rs and anyone who says otherwise is an inferior lifeform :-)

However, I'll come out from under my bridge, take a nibble from your
snack, and say that I don't think SuSE is suitable because of its
woeful package management and questionable security.

The package management is fine for the sort of people using Linux
nowadays, but is inadequate for use in an appliance. In this regard,
I feel Debian comes closest - but is even less appliance-like than
SuSE in many other areas.

[replies to the above three paragraphs will be cheerfully ignored, as
I ain't interested in advocacy]

No distribution (yet) comes close to pleasing me wrt security*. In
this sort of device, the biggest enemy is not an outside hacker
(although they still need to be kept out) but the owner. He must be
prevented from breaking his toy whilst still retaining the ability to
use most of its functionality, including the ability to install
software. The fact that this would break his ability to upgrade the
system isn't that much of a problem. A boot-time option to either
come up normally or to do an upgrade from the net would be sufficient.
I have some fairly detailed ideas for how such a distribution could be
put together, but I doubt most people here are interested in such
arcana :-)

* - not even in terms of securing it as an ordinary Unix workstation,
let alone as an appliance.

Sad but true. One of the great strengths of X is that it does one job
- providing the ability to network graphical applications - and does
it well. Its great weakness is that it does nothing more than that
one job, and hence the proliferation of widget sets, window managers
and desktop environments leading to infinite variety and infinite
confusion.

>With OSX if you learn how to open a file in one app, great chances more then
>that app will use that method.

Pity that OS X is such utter pants in all sorts of other ways :-)

>I overhead people today in a store discovering why they PC with one click cd burning
>was not working... they put the original cd in the CDRW and the blank in the DVD player.

<sigh> it just ain't possible to design human stupidity out of the
system.

>Under linux it doesn't take much to have mass user be lost to the point that they need
>human assistance. Would you be ready so offer this support to millions ?

Me personally? No. I am insufficiently tolerant of idiots to do
luser-support, and there is nothing to motivate me to create such a
distribution right now. But if someone wanted to make a go at it, I
could be persuaded to work on creating and maintaining the product.
Provided he had a good business plan which would keep me in
pay-cheques for a few years.

>Having a user friendly OS is more then having a tweaked kernal on a CD.

Which is why I talked about an entire distribution, not just a kernel.
An appliance distribution is not going to look anything like a
traditional Linux distro. Sure, the end result may be a nice Gnome
desktop just like you can have with other distros, but the underlying
system will be very different.

I don't know why people insist on calling languages like python and
perl 'script' languages. Just because some people use them as that
does not mean that that is all they can do. I have written some
rather large applications in perl, and colleagues have done the same
in python. They are fully-fledged programming languages.

OK, Pentium III 1Ghz is $172.

A complete 1Ghz Pentium III SYSTEM is $418, same specs as above.

A far cry from $600, or "over $1000".

Again, it's the times.

(Ron did a 'list all' and found 4 posts with 1090 in them.)
Ron, on my news server, I saw a response to the orginal post and
a few other responses. Then, the whole thread was 'no longer available'
on my news server. It is still not in my news.
I checked google and saw four responses, but still not the original
post.
I looked it up in e-bay myself to find it. I wanted to see it.
I'm suspicous by nature, it seems that someone is able to 'kill' system
wide someone else's posts, is what I'm thinking.
I don't want it, but I enjoyed seeing the thing. The current bids
are all by the same 'mssmouse' person, so the auctioner may be posting
bids to his own sale thru another account. If that were true, I think
that's against ebay policy.
Like I saw on google, Rick Cortese smells something fishy about the
auctioner.

Depends on many factors; do they allow a disk boot? Might accomplish it with clever coding of an Autorun.sys.

Game carts and apps with a built in FMS, usually require some hardware like Omnimon or possibly XL Boss.

Some XE carts are bank switched; you need to know number and size and the toggle address register.

>MtaMIMI2000 Mat@Mat.com asked:

>I want to dump some ARABIC XE carts that I have, How can I do that?

-Ron

Experience is something you don't get until just after you need it.

Rick,
Agreeded, its definitely caveat emptor. Problem is that after you "see otherwise", the item will be gone. The 1450 auctions you refer to had no pictures or they stole one from Curt Vendel's site. They were also riddled with other inconsistencies in the description. Pretty much nonsense on the face of it. This one is not an obvious fake. Maybe that means the seller is more clever and therefore more dangerous? To repeat myself, using an escrow service would be prudent. Personally, the thing is not worth $1200 bucks to me.

I wouldn't mind that kind of graphics, and that kind of text mode,
so long as the character sets are redefinable, and one of which
implements a conventional Commodore graphics character set (which
so many people seem to have memorized).

I'm very curios..

With the proliferation and inexpensiveness of todays PC's, what are you using your 8bit to do?

I finally set mine up (again!), and am using it primarily to access Usenet newsgroups though a telnet interface that I've configured.

Responses appreciated.

Hi Doug, whats the problem? It isn't basic, so when you switch the machine
on hold down option. It uses around 4 disks too. So make sure they are all
loaded as images, to minimise disk swapping. If you still have trouble it
could be your images are dodgey.

I think you will need to do a complete upgrade to 128K to make it 130XE compatible but the 65XE and the XEGM "XE game system" only have 64k. But I have not dealt with 800's or lesser. So I cannot truly answer this question. Sorry

4330. Re: If you could design a $300 homecomputer today, what would you choose?

Newsgroup: comp.sys.atari.8bit
Date: 2001-07-16 04:32:48 UTC
From: wbdesnoy@acs5.acs.ucalgary.ca
Message-ID: <9itqpgpoi1@nserve1.acs.ucalgary.ca>
Source record: 35453
Cross-posted to: comp.sys.amiga.advocacy,comp.sys.amstrad.8bit,comp.sys.apple2,comp.sys.atari.8bit,comp.sys.atari.advocacy, comp.sys.atari.st,comp.sys.cbm,comp.sys.sinclair

Hardware:
- 68000, about 10MHz
- 4MB to 8MB RAM
- ROM based OS (patched in RAM)
- 2 or 4 RS-232 ports
- 2 parallel ports
- an AD convert, with 4 inputs and 2 outputs
- 8"x4" LCD screen, high resolution,
high contrast, black and white is fine
- semi-portable design (something which can
be moved while I'm working, but not something
which I work on while moving)
- 64MB to 256MB RAM with battery backup, for
storing documents. Or use flash memory if
it is cheap enough.
- HD 3.5" floppy, for communicating with my
other machines

Software:
- task switching. need not support running
background processes, but I should be able to
access other software while working
- mostly command driven, put pointer is also
available (I'm viewing this from a programming
standpoint. I don't want to waste time
learning an event driven interface, along the
lines of MacOS or Windows, for a "hobby
machine")
- a default command set which resembles the
more common unix utilities
- programming language must support graphical
output, using an easy to learn model (as most
versions of BASIC had, or PostScript)
- a machine language monitor, and an assembler
should be provided by default.

These specifications are purely from the hobbies perspective.
I believe that this is something which I could put to productive
use, yet still learn the workings of (and program) with a decent
level of competence. It should also be easier to document than
the modern batch of PCs and Macs, which everybody appears to be
drooling over.

Who cares about getting with the times. I can't figure out what
to do with a 50MHz box, let alone a 1GHz one (let alone the 350MHz
one I'm on right now).

I would expect something like this to cost between $100 and $200.

Byron.

Yep it looks like it is the same guy with the 1450XL. He ended the auction
early and cancelled all bids after it broke the $1200.00 mark.
I wonder what the motive is here, I bet if we searched around we'd find that
the pics were stolen from a museum website or something.

There is one obvious problem here. The 1090 is pretty useless w/o
expansion cards. When was the last time you saw a 1090 expansion
card. I sent the seller some questions about the box the day the item
went up for auction on eBay. He never replied.

You couldn't get that much ram on a 68000 because it only
has a 24 bit memory bus. You would have to go to a 68030
or so to get the wider data path.

I have to agree.

Let's just limit it to installation. I've installed many versions of Linux over the years. Each one something of a challenge that would floor the average computer user.

OK, I admit that when I installed Mandrake 8.0 on a loaded Pentium III 800 it was a snap. It even recognized my Sound Blaster Live! and a Linksys NIC (Tulip) without any help on my part! But when I tried to install the same distro on a Pentium 100 -- same NIC and a Sound Blaster AWE32, it bombed miserably. I do have Red Hat 7.2 running on that machine, but it was hand-configuring all the way. It would be torture for anyone who was brought up on Windows.

Still, I wouldn't be discouraged about putting it into a $300 computer. Lets assume a high degree of uniformity in the hardware of such beasties. A distro of Linux, or any other OS could be designed to install easily in such a limited hardware environment and probably could be run and maintained just as easily.

I'd also have to say that users of such machines as Atari 8-bits would have the mindset to deal with any problems that came up.

Take care.

Alan

Jim. (what do I use 8-bit for.)
They pretty much sit idle.
Mostly helping George Morrison learn how to use APE to get
his large A8 collection over to PC.
I've just about gotten everything over to PC of mine.
There are a few things you can't do except with a real A8.
Formatting a disk image seems to be one thing, emulators won't work to do
that.
You can use APE Pro system to play your copy protected disks,
you mention AR, dungeon, city. There are cracks around of the
disks, but if you want to play from a Pro image, that'd be a way.
Of course you'd have to have the Pro cable.

(Ron gives some ideas about dumping A8 carts.)
Right, Omnimon, a special OS for the Atari that allows interupting
cartridges and dumping to disk sectors.
I'm not familiar with the XL Boss Ron mentions, but guess it does
the same thing.
Ron also mentions dumping using a autorun.sys file, if the cartdridge
boots a disk.
It is a little advanced, dumping carts.
Also, Ron mentions being able to dump banks, if you know the
cartridge has bank switching. Probably your carts are not bank switched,
so that wouldn't be necessary.
I'm just repeating what Ron said, but trying to explain.
If you had a Omnimon, you'd put the cart in, have a single dens. formated
disk in D1: and turn computer on.
Then to enter Omnimon you hit SELECT RESET.
From there you enter an Omnimon command to dump $A000-$BFFF
to disk sectors. Then you'd need to be able to take the cart out, boot
a DOS and read those sectors to a file, and you'd have your dump.

Edward.
Right, I think, xldj is like a sio2pc or APE for the ST.
That's the only way I know to do it (format an image), use
APE or sio2pc on the PC, or xldj for the ST.

He (the seller) says he's giving the unit to a friend.
Still something fishy. He austensably could sell it for $1200+ and
he gives it to a friend?
It was interesting just to see the pictures. They look like real pictures
of a real unit. The front looks like where you plug a 50 pin ribbon
cable into the parallel bus on the Atari.
The 1090 someone said never worked, and there are no cards
to plug into it available, maybe none were ever made.
I suppose the idea of the thing was to use PC parallel port cards,
PC MFM/RLL hard drive controllers, maybe serial port cards, modems.
But from what people said, it won't use old PC cards, it required specially
built cards that were never made.
What was the idea of the 1090? Seems I remember someone saying
it was for memory expansion on the 600XL?

I felt as though I needed to throw in a bit on this subject.

You wouldn't have much choice on the CPU because the older the chip, the harder it is to get. Designing with the latest allows you to get production quantities with manageable lead times so inventory can be kept to a minimum. The older the chip, the more you have to buy at one time to assure you have it when it is in short supply or no longer available.
Also, you have to use larger memory blocks/chips for much the same reason as above. If you can design and build with the most demanded memory, it is cheaper to get but takes longer because of demand. Compare the cost of 256 meg of: PC2400 DDR to PC133 EDO and you'll see what I mean.

Much has been said in this thread about why some one would design or buy such a computer rather than buy an intel type pc(PIII). IMHO, it is more a question of following the group and being a MS slave or trying something new and different. Perhaps even doing so while not filling bill gates pockets with even more money. I'd mention apple but MS has got its fingers in that pie too.

My old Atari (400 w/flat keyboard through an ST) were reasonably stable, fun to use, great learning tool (both for hardware hacking and software) and were ahead of their time(well not the ST<GRIN>)..

I'd gladly trade my Athlon based PC for a good, fast, up to date Atari type computer. But unless it had software that is "compatible" and up to date, it really is a "pipe dream".

I'll step off my soap box. That's for the chance to express my opinion(s)

: or so to get the wider data path.

Then throw in some sort of decoder for the 64-256MB chunk. Since it is not the main memory (that would be the 4MB chunk), it should not make much of a difference. Indeed, it need not make any difference to the average programmer, since it would (presumably) be access through a set of file system calls.

Besides, isn't the 6502 limited to 64kB chunks. Apple simply implemented some sort of paging mechanism to access the 128kB found in later models (IIe/IIc). Likewise for the 192kB card which I have lying around here, somewhere. (Though my understanding is the 1MB card for the 8-bit machines used some sort of window into memory.)

Byron.

If memory serves, they did a pretty good job of copy protection on AR.
Not enough to prevent it from being cracked, but probably enough to deter
an amateur for a while :)

The main problem I had with my copy of AR was just simply wearing them out
from excessive use!

Source record: 35465

Hi all,

I have contacted quite a few venders the last few weeks about many Atari 8-bit products. As a hobby and nostalgia, I am hoping to create a similar system to one I used to own and put up a BBS again. My old system - 15 years removed - was a wonder considering I owned a 10MB Supradrive and ran a Carina then Carina II BBS.

Why do I want to re-live the past? I dunno, because I feel like it.

Which brings me to why I may need a psychiatrist.

I won't name the vender, but I was inquiring about a couple of Indus GT drives. But upon placing my order, I find out that this so-called business man wants me to send a money order to a friggin' PO Box. He can't accept Paypal (they don't like Atari users), Personal Checks (he doesn't have a bank account?), Credit Cards (Who knows?). He has no home or business address?

A money order in the name of an individual with a common surname to a PO Box?

You're kidding right?

I wouldn't even post this here if his site wasn't linked by so many others. And now I see myself having a conflict of interest because of what my plans are.

I figure there are a few thousand Atari 8-bit enthusiants worldwide. From the few venders available, is this the norm? If so, I will certainly reconsider my plans.

Kind Regards,

Dave

I have a 1090 myself. I purchased mine in a surplus store about 15 years ago. The backplane is basically just an extension of the connector that is on the back of the 800xl (just a bunch of 50 pin connectors). The form factor for the cards is not the same as any other computer. So Atari's intention was clearly to have developers make new cards for this box. As far as I can tell, there is no reason why the 1090 would not work.

My intention, when I got it, was to make use of it to expand my 800xl for doing various things. But, then the 130xe came out, and then the ST, and I lost interest, and the 1090 has been sitting in a junk box for all of that time.

One thing for sure, I would never pay $1200 for one of these things. Atari history or not.

In some ways, I think it is too bad Atari lost interest in the thing. But at that time, Atari was loosing interest in a lot of things.

I know which "business man" you are talking about, and I just have to say, along with others here who know, that he has been honest, prompt and very reliable in over a dozen transactions with me over the last few years.

Yes, his way of recieving payment is a little old-fashioned or "small-time"... however, there is not a lot of money to be made selling Atari computers these days... it really is (just as you are experiencing) a fun hobby for most of us. Selling Atari products is his primary source of income, thus he needs to keep costs low.

I'd encourage you to give him a try... I think you'll be pleasantly surprised.

If not, however, there are larger Atari dealers still in operation which take credit cards and handle paypal, etc.

try:
http://www.myatari.com
http://www.nleaudio.com/css
http://www.best-electronics-ca.com

best of luck in enjoying your Atari past...

Memory Management Unit which really extends the addressing
the processor has. To the programmer, it is as if you had 32 bit
addressing. You set the MMU chip to "bank" of RAM you
want and pass the rest of the address to memory bus. However,
you would then need to develop a MMU and the added cost
of R&D would increase your cost to build. It would be safer
to just move to a 68020 or 68030 processor and bypass the
smaller bus. I would think the chips are not much different
in cost these days as they have been around a long time.

4355. WTB: Ultima 1-VI for C64 or Atari 800.

Newsgroup: comp.sys.atari.8bit
Date: 2001-07-16 16:03:40 UTC
From: john@jrcc.net
Message-ID: <de16c5ec.0107160803.4c4e85f9@posting.google.com>
Source record: 35480

Hi,

I am looking to buy copies of Ultima I-VI for the Commodore 64/128
and/or the Atari 800. Boxed games w/ original docs would be cool.
But, I am a realist, I’ll settle for copies. I am mostly
interested in actually playing the games. I’m not really a
collector.

If you are interested in selling such items e-mail me at
john@jrcc.net.

Thanks,
John

I seem to recall that the Mandrake 8 graphical installer needs something
like 64Mb of RAM and having less is pretty much the only thing that I've
ever seen cause it to bomb out.

And Red Hat sucks big time. Even the latest version.

> 'script' languages. [...]

The way that I differentiate between 'script' and 'compiled' languages is,
roughly, this...

If the compilation (and linking) step is commonly separate (C, C++, Pascal,
Ada...), it's a compiled language.

If the compilation step is integrated into the runtime environment (Perl,
Python (I think)), it's a scripted language.

If the compilation step is omitted altogether (BBC BASIC and purely 8-bit
BASICs), it's an interpreted language.

WHAT?!?! 24 address lines gets you 16 megabytes. He's taking 4-8
The fact is that the Mac Plus had 24 address lines and 4 megs. - and that was
in 1986!

: what that is?

I have one. It's a device that you'll have to connect to the parallelbus.
On it, there is place to fit 8 EPROMS on it (64KB each). With an
EPROM-burner you can make your own EPROMS, put it on the ROM-Disk board,
and acces the data in the EPROMS as you would load it from a RAM-Disk.

: or 68030 processor and bypass the smaller bus.

Perhaps I'm oversimplifying things here but, assuming 1MB pages into this secondary memory, wouldn't an 8 bit register attached to a decoder suffice?

As per the 68020 and 68030: it sounds great wrt speed and functionality, but what would be the cost in complexity (for the end user, of course)?

This is, in essence, a machine which I would want the user to be able to pull apart and modify, if they so desire, without a degree in electrical engineering. I have seen people modify the old 8-bitters, and there are people who will modify (for example) the TI-89/92 calculators (which are based on the 68000). I have not encountered people who go to such trouble for i386 or later, or the PowerPC. Just peeking into the processor manuals for those beasts is very intimidating. I can hardly imagine what a complete set of documentation for a modern PC would look like, if such a thing existed.

Byron.

>Me georgezip@btinternet.com asked: a question in subject line...

Theoretically, yes. A lot depends on your hardware and programming ability.

Most PC floppy controllers do NOT support FM single density formats and the
majority of images are in this SD configuration. If yours did handle SD, I have
never seen any software to write the data.

There are utilities for writing files to an MFM double density Atari/MyDos disk
in the PC 5.25 floppy such as:
http://www.horus.com/~hias/atari/
But these utilities do not currently support writing DOS files or duplicating
complete DD images which the controller should be capable of doing.

> <snip>

WRONG WRONG WRONG!!!!

Go check the 68000 Data book. For that matter take a course in basic digital electronics. A 24 bit address bus will support up to 16megabytes total with no extra tricky hardware requireed. Btw, the data path is irrelevant to amount of ram a cpu can address, data bus is strictly for moving DATA, wider will give shorter read times for large values. the Address bus determines how much memory is available without resorting to such things as bank switching & so on. Btw, the 64 to 256 megs of flash mentioned could be addressed with some additional hardware. This is not "pie in the sky fantasy", but the common techniques used on apple II, commodore & atari 8bits that supported more than 64k of ram + roms.

If it's a money order you have a MO # and recourse if there is a
problem. A lot of people use PO boxes for business purposes. You can
move your residence within an area while keeping the PO box. There are
a bunch of reasons to use a PO box. I use one.

>Paypal (they don't like Atari users), Personal Checks (he doesn't have a
>bank account?), Credit Cards (Who knows?). He has no home or business
>address?

Opinions differ about Paypal. My opinion is they use offensive viral
marketing practices where each user is recruited as a salesman. I do
business at an online auction service and this results in a bunch of
Paypal users leaning on sellers "oh why won't you use Paypal it's
great and much more convenient for me" but sellers don't always want
to sign up for this and that and deal with Paypal debiting and
crediting their accounts and keeping up with that BS.

As for credit cards, a lot of small time sellers aren't equipped to
take credit cards, and they don't have (800) numbers or anything else.
Goodwill stores and thriftshops don't take credit cards. McDonald's
and Burger King don't take credit cards. A lot of autorepair shops
don't take credit cards.

That's up to you, but I really don't think you have anything to worry
about. Keep your antennae up for other suspicious factors, or ask for
a phone number to call the person if you are worried.

I also reassembled something resembling my original Atari 800 system.
Fun stuff and nothing else really matches the experience.

Not available.., I think thats true, but there were some avaialble a while
ago. A friend of my has a 1090 with 3 cards. One is a memory-card,
another an I/O card (kind of COM port) and the third one I don't know...

An unfortunate design defect of the 80386 is that it can't
execute 6502 code. Maybe if Intel could get its sh* together,
it would design a chip that we here at comp.sys.cbm might
actually be willing to try out.

Python can be either, just like emacs Lisp. Of course, it 'compiles'
to a byte-code which it then intreprets, it's not *real* compilation.

Perl also has seperate compile and execute phases, although at present
you have to do truly evil things to presuade it to spit out the
byte-code.

However, I think that that differentiation is bogus. It means that
most implementations of Lisp are not programming languages. It means
that if (god forbid!) you were to run C in an interpreter, it would
not be a programming language.

Dude. He said he wanted 64 meg to 256 meg of RAM. A
68000 with only a 24 bit address can't address larger
memory schemes. 16 meg would be the limit of a 68000.

> in 1986!

Apple crippled the memory on the early machines. The later
LC had 10 meg of RAM available although 6 meg was set
aside for ROM. The Mac Plus was even worse. It was limited
to 4 meg because Apple didn't let the Mac support larger than
1 meg simms. It only had 4 simm slots. To go larger it had to
support larger simms like a 4 meg simm. However, on the Mac
Plus/SE, Apple set aside 8 meg of address space for ROM. This
limit was not broached until Apple decided to make 68020 based
machines with larger address space. He is wanting 64 to 256 meg
of static RAM.

You could say the same thing about e.g. Javascript too: it has a full
set of bit-fiddling operations, numeric operations, string operations,
and it's even object oriented. But it's still considered a 'script'
language....

The reason these languages are called 'script' languages is probably
because programs in these languages usually are interpreted rather
than compiled.

"But Basic is interpreted too!!!" I hear you cry. Yes, it used to
be, but that was a long time ago - today it's usually compiled.
However, it is still sometimes interpreted - one such example is
VB-script.

A vendor, however, will be paying for OEM Windows, not retail. The OEM version is usually much cheaper, but with stricter licensing (i.e. must be sold with a computer, can't be installed on another PC, etc.). So, figure US$50-$75 for Windows, maybe even less.

I contacted him last year and told him that ATARI NAJM 65 XE (NAJM means STAR) is not made for IRAN, WHY??? because IRAN IS NOT AN ARABIC country, IRANIANS speak PERSIAN not ARABIC. And the in the gulf countries what people use are multi system TV's to be able to receive both the PAL and NTSC transmission, so we can use an ATARI made for the US or a UK AMIGA. Which means this machine is not a prototype! Then he replied to me and promised to fix site. But it is more than a year and he did not do it! maybe he is busy!

4392. Ape 1.18 Help!

Newsgroup: comp.sys.atari.8bit
Date: 2001-07-16 21:31:46 UTC
From: <>
Message-ID: <9ivmg2$e13$1@news.xmission.com>
Source record: 35416

Help! I've setup my super 130xe, and a dedicated Compaq ProLinea Net1 (486/66 Dx2) to run Ape 1.18.

I can see the 8bit hitting the PC when attempting to access an ATR, but the PC just flips between APE+ and Ultraspeed OFF, but the 8bit never quite talks to the PC.

I'm connected via COM1: on the PC (9pin serial), and have a Steven Tucker built Ape cable (not PRO) connected via a straight through (9pin to 25pin) cable from the 8bit Atari to the PC.

Any suggestions appreciated.

Well, I've stumbled onto something with my odd Ape 1.18 problem..

If I toggle EMULATION (on the PC) to STUPID, after about three attempts,
it begins to work. If I then set EMULATION to SMART (on the PC), it stops
working.

Why would this be the case?

Yep pretty normal if you don't feel like waiting on an online auction to
come up. I would suggest sending a postal money order via registered mail.
That way if he screws you it's postal fraud. Hang on to the money order
reciept. Mo

Oh sure, throw in this non-standard bit of chaff here($), and that non-standard bit of dross there ($$) and pretty soon you find out why things like "Atari clones" cost a small fortune. Some sort of decoder here, and a bank-switcher there, and we're not talking about $300 retail any more.

And how much did that 192k card cost?

And how much would that translate into today's currency?

A 48k RAM expansion board for an Atari 400 retailed for $150, which in todays dollars would break this project before it got started.

Low volume, non-standard, high cost.

>Byron.

It's called "Market Research".

It's part of the process of finding out if there is already something
on the market at the same or lower price point.

If someone is already making something like "The Wonder Widget" and
selling it for half what it would cost YOU to make your version of a
Wonder Widget, it wouldn't make any sense for you to try to sell one,
and it wouldn't make any sense for anyone to finance your business.

If Gigahertz computers still cost $3000, it might make sense to try to
come up with a $300 computer that would do a lot of the same things.

Unfortunately, as some of the messages here have pointed out,
Gigahertz computers now cost as little as $350, making a "New"
computer based around some arcane, non-compatible, possibly obsolete
CPU chip, with no software available, and a user-unfriendly operating
system an awfully "hard sell" in the marketplace.

Companies like Atari, Amiga, Sinclair, (fill in the name of any one of
dozens of others) and even Apple have found out the hard way that just
having a "superior" box won't do any good at all if no one buys it.

The question is, who will buy this new $300 box?

Uhm.
I haven't tried 1.18. But it looks like the 1.16/1.17.
The only thing I can think is to get rid of the serial cable and
connect directly from A8 to PC just using the, I guess, very short
APE cable (I think it is only about 18 inches long.) Or get a
shorter serial cable. I'm thinking the problem may be that extension
cable.
I didn't know there was a 1.18. The docs say that there is a free
upgrade, I think, but I don't know how to upgrade. I have registered
1.17.

So where on this planet do you live?

Check (as I said a few dozen messages ago) www.pricewatch.com
and find out how little a PIII Gigahertz SYSTEM really costs.

(Here's a hint: $418, INCLUDING Windows OS)

Or go for an Athlon Gigahertz for about $300 (again INCLUDING
Windows.)

A life is at your own discretion.

Ignore it, it'll go away eventually.

It actually DOES have relevance to the Atari 8-bit world, as the
inspiration for designing a new inexpensive system harkens back to the
venerable Atari Home Computers that brought "Power Without The Price"
to the few dozen people who ever bought one.

(and yes, I have an attic full of them myself)

There's a lot of nostalgia for the "simpler times" and the "simpler
machines" which populated them.

I get nostalgic every time I think about spending $550 for a floppy
disk drive.

Unfortunately I doubt anything is ever going to bring those times back
again.

A further "design defect" of the 80386 is that I don't believe they're
being made any more.

Well that is more than what I do with mine. I mainly play games on my
400, XE and XL. I have some other educational programs that I use also.
I am currently run my Xl/XE using 800XLDJ, a SIO2ST(PC) cable and my
Hades060.

Yes, that is possible but you do not have to have a PC. I use 800XLDJ which uses DI images and I can use the DI images to make my XE write the info to an 8-bit disk. You can use APE when using ATR images and have a PC write the info on a 3.5" disk.

Well if you use 800XLDJ, you could load in 8-bit programs using the
SIO2ST(PC) cable. You just hook up the 8-bit computer to the STfm, STe
or Falcon using the cable. The run 800XLDJ and load in a DI image disk.
Then turn on your 8-bit computer and it will load in what is loaded in
the 800XLDJ program. Beats an 8-bit disk drive. 800XLDJ is free.

I just set mine up and I can't remember this before, but
with a 1050 with sio to computer and my 10 foot APE cable,
I can't get good boots unless I hit 'T' for 'STUPID'. The ultraspeed
stuff just hangs part way thru boot. This is with 1.18 unreg., 1.17 reg.,
or 1.16 unreg.
Since your setup is 'trying', just give up ultraspeed and set 'Stupid'
mode and try that.

thats happened to me before also... but only when I'm running ape from
win98. In DOS 6.22 it works fine.

For better windows compatibility, go to the settings screen and choose force
2x SIO speed. If that doesn't work, choose force 1x (normal) SIO speed.

But he mentioned 4-8 megs of RAM, which is VERY doable with a 68000, and the 64-256 as battery backedup RAM disk for documents. As RAM disk, the address lines aren't the issue. You can have 1 meg RAM disks with the Apple][+.

You didn't read what he said very carefully:

Hardware:
- 68000, about 10MHz
- 4MB to 8MB RAM
- ROM based OS (patched in RAM)
- 2 or 4 RS-232 ports
- 2 parallel ports
- an AD convert, with 4 inputs and 2 outputs
- 8"x4" LCD screen, high resolution,
high contrast, black and white is fine
- semi-portable design (something which can
be moved while I'm working, but not something
which I work on while moving)
- 64MB to 256MB RAM with battery backup, for
storing documents. Or use flash memory if
it is cheap enough.
- HD 3.5" floppy, for communicating with my
other machines

And, in his reply he said:

> Then throw in some sort of decoder for the 64-256MB chunk. Since
> it is not the main memory (that would be the 4MB chunk), it should

> not make much of a difference.
>

So, 4-8 as main memory, easily accessed by a CPU with 24 address lines,
and 64-256 battery backed RAM disk, which has little to do with address
lines.

68000, 80286 (or higher), or 65816 could do what he was thinking, as CPU.

This is true but the other memory is still memory and has to be accessed
in some manner. Plus we are talking about a sub-300 dollar machine
and any custom logic is going to cost money.

Oh really. You still have to get stuff in and out of your RAM disk and it
takes address lines. You will still need an address decoder to be able
to switch banks of RAM in and out of main memory. It doesn't happen
like magic. A real address in memory must somehow find its way
to the correct bank of RAM that you want to access. It is a real
pain in the butt doing it that way. The Apple II couldn't address
more than 64K or RAM at any one time anyway. Programs
never exceeded the size of memory space. The 68K is a totally
different animal. Programs can be huge on a 68k machine. I don't
think you would want to bank switch RAM to run a program.

If you want something all singing all dancing then even if I could design something better than a PC I haven't the time to write all the software to go with it.

If however you want to just make a computer for the satisfaction of saying "I made that" then I would make a clone of an antique home micro. The hardware design would be feasible, and you wouldn't have to write lots of software for it. The hardware could fit in fewer smaller parts than the originals, with modern memory chip sizes.

A few candidates would be:
ZX81 in PLDs or FPGA (done by Ian Bradbury and Bodo Wenzel respectively see http://www.howell1964.freeserve.co.uk/ZX81/ZX81.htm)
Commodore C64 in FPGA (done by Jeri: http://www.geocities.com/cm_easy/ - impressive!)
Acorn Atom / BBC micro / Atari 800XL / Atari ST / TRS80 / Spectrum in FPGA

Some other stuff.
Keep copies of your .ATRs somewhere besides the ones you use
in your APE directory. I was corrupting .ATRs, I think only in
'SMART' high speed mode. I'd look at the APE screen and it
would say 'put sector' on my boot disk, when I was booting!
You might also want to 'W' write protect the boot disk, and any
other disk you know you won't be writing to.

Why not using 80386, then ? It has it all- MMU and segmented adressing, and
one
even gets a several 100's bytes of cache ? ;o)

(Shoot, I wanted to say something else.)
In APE configuration, if you look at the ultraspeed config, it says
only Sparta FTE 3.2g can handle APE+ 3x speed.
I still couldn't do APE+ speed with 3.2g and had to use 'STUPID'
mode.

The older machine has 64 Mb of RAM. Maybe it needed just a trifle more.

But my point was that any OS that's specifically designed or customized to work with a very narrow range of hardware variation could be successful on these supposed $300 machines.

Omnimon and XL Boss allow you to take control of the system from a game or other app which is not openly interactive.
The Atari computer with these enhancements is the simplest means to access the chip contents; it is either that or design and build a circuit board with logic to read the cartridge slot and send it to your peripheral of choice.

Consider Basic with commands like Byte = Peek(40196) & Open #1,8,0,"D1:Dump" & Put #1;Byte where you can look at the data in the cartridge memory and write it (slooowwwly) to a disk file. Now try to visualize how you would do that with a Star Raiders cart; you just cannot get to it without help...

The computer will start any cart present during cold (power up) or warm (system reset) start. A warm (re)start is the quickest and simplest way to start an interrupted cart since you don't need to know or find the start address.

The OS usually keeps itself since it is normally in read only cannot be erased memory; except for XL-Boss which allows a RAM OS with its monitor at $C000 and then protects it during system reset. You needn't worry about it.

> Python can be either, just like emacs Lisp. Of course, it 'compiles' to a
> byte-code which it then intreprets, it's not *real* compilation.

So using javac isn't real compilation either...? I'd say that it's real
compilation, just for a virtual machine.

> Perl also has separate compile and execute phases, although at present you
> have to do truly evil things to presuade it to spit out the byte-code.

:-)

> However, I think that that differentiation is bogus.

It definitely isn't a clear and /clean/ differentiation... and I did say
'roughly'. I don't expect to stick rigidly to that :-)

> It means that most implementations of Lisp are not programming languages.
> It means that if (god forbid!) you were to run C in an interpreter, it
> would not be a programming language.

Slight edit needed, I think: "is commonly separate" => "is or can be used as
a separate step"... and yes, I've seen a C interpreter...

I wouldn't be too surprised to see that. -

I just did a little poking around to check on prices of Motorola 68020
and 68030 CPUs, just to see how they would affect the cost of a $300
system.
```

Allied Electronics doesn't even stock them any more, but for only $200
they'll order you a 33Mhz 68020 chip.

That's almost THREE times the cost of a 1Ghz Athlon right now.

(And that's their QUANTITY pricing. Ouch!)

Supply and demand at work.

>If I toggle EMULATION (on the PC) to STUPID, after about three attempts, it begins to work. If I then set EMULATION to SMART (on the PC), it stops...<

I had essentially the same problem. Mine would work partially as long as I had the emulation set to "Stupid" and would not work at all on "Smart." (And this was under DOS, not a DOS Window.) I did 3
things that took my system from "doesn't work" to "works flawlessly."
1. Built a new cable with a 14C89 (instead of a 1489) to the specs/diagram shown on Clarence Dyson's site. I also built a MAX232 cable, but it works no better than the 14C89.
2. Limited the number of SIO (real) drives to one. Two real drives were fine at standard speed, but "iffy" at 3X APE Warp.
3. Started using a STOCK 130XE rather than an expanded XE or XL. This might suggest a power supply issue, but I believe it was a timing problem.
I later got Win APE -- it works no better, but (IMO) there is no comparison as far as the user interface goes.

I asked this question two months ago, and no one really had an answer. I did some research though and got a short reply from TV One about a product that they make for $160. http://www.avtoolbox.com/miscvideoproducts.htm

>Take a look at the CMT-7 Decoder/Tanscoder on our consumer products website
>www.avtoolbox.com
>
>David K. Barnes
>dbarnes@tvone.com
>TV One Multimedia Solutions
>www.tvone.com

You would have to find the pin out of the SC1224 and make a cable.

In my search though, I found the cheesebox http://www.avtoolbox.com/video-to-vga.htm. For $70 it allows you to use a VGA monitor instead. I have heard it's output is fairly good.

I haven't tried either myself yet.

Really. I have a 1 meg RAM card in my][+. There were a number of such cards sold. And some were battery backed. 16 address lines, 8 bit bus and 20 bit address space. Surely you have seen such in ads. And since that was done with an 8 bit 6502, I'm sure the 16/32 bit 68000 could do it too.

> You still have to get stuff in and out of your RAM disk and it

RAM disks aren't part of your main memory. DUH!! Do you bother to read any of the posts being made? The software that organizes the RAM disk is in your memory, but as far as the CPU is concerned, that chunk of RAM is no different than a hard disk or floppy disk. Or do you wish to assure that disk drives are also part of the CPUs memory, being switched in and out?

> It doesn't happen

> never exceeded the size of memory space.

Wrong! Programs often exceeded memory space. It was called overlaying. Ever hear of WordStar? And yes, that was a Z-80 program, but 6502 programs did the same thing. The overlays were on disk, called in to replace a part of memory (much like bank shifting, but much, much slower). With a RAM disk, exactly the same thing happened, only the data/code was stored in RAM outside the memory space of the CPU, and organized as a RAM disk.

The Coleco ADAM did this, so did the Atari 130 XE. There were plenty of boards like this for S-100 computers using the Intel 8080 or Zilog Z-80. In fact it was the best way to use CP/M Wordstar. Some would say, the ONLY way to use WordStar.

> The 68K is a totally
> different animal. Programs can be huge on a 68k machine. I don't
> think you would want to bank switch RAM to run a program.

No one was talking about bank switching.
He was talking about a 64-256meg battery backed RAM disk though.

I have a large box of Atari stuff free if you pick it up.

2 x Atari 800
1 x Atari 400
2 x 850 expanders
1 x 810 floppy drive
2 x Atari 1020 pen plotter/printers still in the box.
RAM cards, ROM cards, a few game carts (Qix, Defender,...),
miscellaneous boards, chips, etc,

I live in San Jose CA. Call quick if you're interested,
otherwise it all becomes landfill.

Bob Retelle (bobr1@provide.net) wrote:
: The question is, who will buy this new $300 box?

Perhaps nobody. We are simply playing with ideas here.

Or, perhaps, somebody. Look at the groups this discussion is taking place in. How many people would even consider using these machines in an era of GHz computers? After all some of these machines run at a poky 1MHz, and are crippled by 8 bit wide words. (My Apple II fits in that category.)

Apparently a large number of us still use those machines. Some of us still buy those machines. Sometimes we pick up the original thing (Apples, Atari's, Commodores, and so forth) for a bargain. Sometimes we pickup devices which have similar, embedded processors. The TI graphing calculators use the Z80 and 68000 processors. These calculators appear to fit in the $80 to $220 Canadian range, and I'm willing to bet that there are good margins.

So maybe there is a market. But that still shouldn't prevent us from discussing ideas.

Byron.

4432. FS/T: Atari 8-bit computer items and more... [07/17/2001]

```
All Video Game Advantage (VGA) FS/T lists are updated approximately
every ten days available on the WWW at http://www.io.com/~vga2000/

*IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT*

The 'Sale Conditions' and 'Ordering Instructions' sections are at
the end of this message. Please read them both carefully *BEFORE*
asking any questions, or placing any orders. Thank you!

*IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT*

This list was last updated on 07/04/2001
----------------------------------------
NOTE: There are currently 1958 ORIGINAL game screen shots available
on my web site, including 52 for the Atari 8-bit computers!

NOTE: There are currently 857 game manuals available on my web site.
Unfortunately, none are for the Atari 8-bit computers, at this time...

NOTE: The Video Game Advantage Definitive Known Software List
Collection list for this system is currently on-line!

I have the following Atari 8-bit software, hardware, and accessories
for sale or trade.

There are a few items that are listed as untested. When I bought
these items I was told that they all worked, but due to a lack of
time, I have been unable to test them myself.

SOFTWARE:

NOTE: If the company name isn't listed, then the game was released
by the same company as the system.

NOTE: All cartridges are loose (ie. without box and manual), unless
specified.

NOTE: Since all cartridges are used, some labels will have small
defects. Major defects will be listed.

ATARI 8-BIT COMPUTER:
---------------------
Loose cartridges, no box or manual:
$ 2.00 Missile Command
$ 1.50 Space Invaders
$ 3.00 2-pack: Missile Command and Space Invaders
```

Accessories:
$ 1.00 "A Note Regarding Software" letter: Atari Home Computers
-- some rips
$ 4.00 Atari 1010 Program Recorder Owner's Guide (16 pages)
$ 4.00 Atari 1200XL Home Computer Owner's Guide (20 pages)
$ 8.00 Atari 65XE Personal Computer Owner's Manual (138 pages)
$ 4.00 Atari 800XL Home Computer Owner's Guide (24 pages)
$ 4.00 Atari BASIC Reference Guide: For Experienced Programmers
(16 pages)
$ 2.50 Atari Home Computers: The Next Generation catalog
(32 pages)
$ 8.00 2-pack: Atari Disk Operating System Reference Manual:
DOS 3 (112 pages). Lot also includes An Introduction
to the Atari Disk Operating System: DOS 3 (32 pages)
$ 8.00 Inside Atari BASIC [Atari / Reston] (196 pages)

[Pictures of the items listed below will be available soon]

HARDWARE:

NOTE: The Lots listed below include only what is listed!

LOT #1

ATARI 1050 (127K) DISK DRIVE.

This disk drive does not include the power supply, or Molex
connector cable.

NOTE: Light comes on, and drive tries to read disk, but drive will
not boot up. Sold as non-working item, possibly repairable, for
parts only!

$ 2.00

*****

LOT #2

ATARI 1025 PRINTER, with built-in power cord, and manual.

This item has not been tested.

I have plugged in this printer, and after powering it up the power
light came on and the print head moved.

$ 7.00

*****

SALE CONDITIONS:

1) Sales are first come, first served. If you are looking for
something that isn't listed, please don't ask (because if I
had it, I'd list it).

2) Everything is sold as is. Unless specified, all games and systems have been tested and are in working order. I very rarely sell items that aren't working, but if I do, they are clearly labeled as such.

3) Trade offers, in particular for items that I need, will be considered (especially if the trade offer overwhelms me). I collect for over 50 different systems, so please feel free to send me a trade list. My want lists are on my web site.

4) Buyer has ten (10) days to send payment, and pays all shipping costs. Shipping cost depends on both the weight of the order and the distance that the order must travel, unless a set amount is already listed. No orders will be sent C.O.D.

5) Since items will be held specifically for you, if you aren't serious about buying, please don't place an order!

6) No package deals on games or systems. All prices are clearly listed. There is no minimum order.

7) If you have a problem with the listed price, please remember that nobody is forcing you to buy from me. I have been in business since 09/05/93, so I have a good idea how to price items. My personal philosophy is that something is only worth what someone is willing to pay for it.

8) Payment must be made in U.S. funds (either check, money order -drawn from a U.S. bank branch-, or cash. Orders from outside the U.S. are also accepted (also, please check out my want lists, since some items are only available outside the U.S.)

9) I reserve the right to refuse any sale or trade offer, and to correct mistakes made while typing this message.

*****

ORDERING INSTRUCTIONS:

To reserve any item(s) listed here, please do the following:

1) carefully read the SALE CONDITIONS section first,
2) please make sure that you are going to follow through on your order *BEFORE* you place it,
3) next e-mail me a list of the items that you are interested in (please quote from the FS/T message, but not the entire thing!),
4) also include your full name and full postal mailing address (this information is for internal VGA use only, and is REQUIRED!),
5) I will reply with a shipping information message for your order.

Thank you!

Bob Retelle (bobr1@provide.net) wrote:
: Allied Electronics doesn't even stock them any more, but for only $200
: they'll order you a 33Mhz 68020 chip.

That price is insane, and I suggest that you shop around more. And focus on the 68000, which I have seen in calculators costing about US$120. I am quite confident that the manufacturer is not producing these at a loss, and likely have a healthy margin. One of these calculators served as my inspiration, only with boosted I/O capabilities, much more open design, and with the OS in ROM where it can not be damaged. (I pulled mine apart, and it used a Motorola 68000.)

I will not argue withthe PB100 hypothesis though, as I am a Mac user.

It is worth noting though that only parts of the Macintosh and IIgs operating systems are in ROM. For the machine to be in a useable form, the rest must be loaded from disk (the Classic was an exception, but even it does not spring to life as an Atari ST would). Indeed certain drivers required to access the original Macintosh hardware do not appear to be in ROM, including part of the serial driver, the print manager, and the AppleTalk manager. (From Inside Macintosh Vol. I.) details are bound to be different for later models, such as the PB100, but I would imagine that (proportionally) less was integrated into later versions of the ROM.

Now why is that relevant? Well, I would want the whole OS in ROM. That way, if you goof up while creating patches, you simply reset the machine (or, better yet, disable patches while booting in order to recover your data). This calc of mine (with the OS in flash memory) has given me a scare a couple of times, and certain parts of its software do not appear to work correctly to this day. It is, of course, poorly documented so that is a problem too. Hopefully the ROM would be socketed, so that the OS could be upgraded (or the patches incorporated in some optimised form).* But that is not a huge issue. The other reason for a ROM based OS is to avoid the lengthly process of reinstalling the OS, as I'm certain many of you Windows users enjoy. ;-) The patches would have to be reinstalled, but your machine wouldn't be in an unusable form without them. If the patch installation system is sensible, they should be quite easy to copy from a floppy disk to a system folder anyway.

Byron.

[*] Come to think of it, wouldn't flash memory have a write enable line? If so, a manual switch or jumper on this line would be a suitable alternative.

> possible to design programs which bank switch code and/or data in and
> out of the CPU's address space. With care, it need not even be a pain
> in the butt.

I did say that they would have to be bank switched. It would still
need an address range to move the data to like that extra 64K on
the 80 column IIe card does. It is bank switched. What I meant
in saying they didn't exceed the size of memory was that only
64K could be accessed at one time. To get more memory requires
the programmer to bank switch the program or to swap code
out and pull it from the Floppy/HD in his code. No hardware
or OS automatically handled that on the Apple II. The early
PC's like the 286 had all kinds of odd ball memory due to the
8-bit legacy of the 286 processor. They still had 64K code
segments and any one chunk of code had to reside on a 64K
bank. You don't want to place a loop on two banks of memory
because that would require you to bank switch constantly.

> For software like a RAMdisk, it's not a pain in the butt at all to use
> bank selection. No different from selecting what sector of a disk drive
> to read in a driver for an ordinary electromechanical disk.

While that is true, it requires special coding on the part of the
program. Not all Apple IIe programs supported the extra RAM
and it was the minority that did. The program had to be aware
of the memory. Some smarter 8-bits using the 6809, had a
MTU unit which would take care of the bank switching. They
had a smart operating system called OS-9 that knew how to
handle the memory plus it had a hardware chip which handled
a lot of the memory management.

The other way was using the Chain command in the older
basics which would remove the app in memory and load
the referenced code. Not all Basics had that command. That
made it a bit easier but on the Coco, it required the programmer
to write routines to access the memory. It was not handled

automatically by the OS.

I'm not only looking for 'rare' cartridge dumps, but I also need clean
verified dumps (lot of dumps I have are ripped from multiboot images).
And scans of cartridges, packaging. There are CSV files (comma
seperated, any spreadsheet loads them) which list what I'm missing on my

With atari800dos it should be possible to take any .atr file,
mount it read/write and then format it using a normal dos command.
At least the code is in the sio emulation source for at least three
years, probably much longer.
Tell me if this really doesn't work and when I find the time I'll
check it. Maybe you then could send me that blank image file too.

What is an "850 expander" ?

The number 850 is familiar as an old 8 bit peripheral, but I cannot
recall what it was.

i have an old sears 4 switch 2600 system. i get an irreparable fuzz
on the screen and a hum. is this related to the wiring, adapters? or
do I have to replace the board? Is there support for replacing a
2600's board on the net?

4444. Supervideo 2.0 mod Question

Newsgroup: comp.sys.atari.8bit
Date: 2001-07-17 16:25:32 UTC
From: Shawn Jefferson <sjeffers@home.com>
Message-ID: <6ap8ltsm1sk12694niif0vqutkh1mgun46@4ax.com>
Source record: 35366

I just recently did this upgrade and it made an incredible difference
for my Atari 800Xl and C1084 monitor. However, I am having one
problem:

Some games do not show *any* color. I don't know if I have done
something wrong, but these games are only showing black and white:

Davids Midnight Magic
Ultima IV
Lode Runner
Championship Lode Runner
(might be more, haven't tested very many)

Other games work just fine:

AR: The Dungeon
Joust
Bruce Lee
etc..

Any ideas on what may have gone wrong, or is this normal? BTW, all
these games look fine using composite video. The supervideo
documentation I am using is from
http://members.nbci.com/_XMCM/atarimods/supervid2.html and I've found
one other site. These dox are a little different, in that one has us
replace resistors and the other has us use two in parallel, also the
site above has us replace R116 with a 2.2ohm resisitor, while the
other site has us solder a 2.2ohm resistor in parallel to the one that
is stock on the board (51 ohm.)

Sometimes one's thoughts and what one types aren't always the same. Perhaps that is why your last sentence is nonsense. Many programs for 64K 8 bit computers were larger than 64K. Some 8 bit machines used bank switching, some used overlays, and some used both (WordPerfect for the 128K ProDOS Apple //e or //c would run MUCH faster if one added extra memory and formatted it as a disk drive, copied the files to the RAM disk and launched the program from the RAM disk. Neither ProDOS nor WordPerfect did any "bankswitching", only the loading of overlays from a disk.

> To get more memory requires
> the programmer to bank switch the program or to swap code
> out and pull it from the Floppy/HD in his code. No hardware
> or OS automatically handled that on the Apple II.

But then, the machine that you protest would cost too much would easily do that. As I recall the 128K Mac used "virtual memory". Was that the ability of the 68000, or the OS, or both? And why couldn't it be done on this machine inexpensively?

> The early
> PC's like the 286

The early PCs, of course, used 8088 and 8086 chips.
The second generation, "Advanced Technology" machines used their 286 and later 386 CPUs as fast 8088/86s.

> had all kinds of odd ball memory due to the

Of course, you have the same situation with the IIgs, because the 65816 has
segmented memory.

No, it doesn't. It only requires RAM disk software. *IF* by special, you mean
the ability to use a RAM disk as opposed to a floppy disk or hard disk.
Again, overlays were VERY common in the late 70's and early 80's. Memory cost
too much, so programers had to use disk space. Besides, you have shifted the
point. You said the problem with his machine was very expensive additional
hardware. Nothing about additional code.

> Not all Apple IIe programs supported the extra RAM

None of the above however deals with the erroneous conclusion that 64-256meg
of RAM disk would require expensive additional hardware to use with a 68000
CPU.

Oh, they are. The 80186 is also still rather popular (it pops up
quite a lot in cheap disk controllers and the like, and consumer
appliances - my fridge has one for no reason that I can fathom). Even
the 6502 and Z80 are still being manufactured for use in embedded
systems.

Bob Retelle <bobr1@provide.net>

: >I'm not subscribing to csa8bit to receive all those info I don't want to
: >read.

: Ignore it, it'll go away eventually.

I surely hope so...

: It actually DOES have relevance to the Atari 8-bit world,

Well, *some* msg's in the thread have a little bit Atari 8-bit related stuff in them. Unfortunately, many of them don't have any at all (notice all the crosspost info). The topic is now more about how much memory you can control with an 68xxx CPU, which has absolutely nothing to do with an 8-bit Atari...

: I get nostalgic every time I think about spending $550 for a floppy
: disk drive.

Time hasn't changed. The 1050 was state of the art in those days. About the same when you go out to buy a good DVD rewriter for the Wintels. Same price, same state of the art, and virtually no value when it's 15 years old. Some people will get nostalgic at the time it hasn't any value anymore, others may still use it, like I use my 1050 drive right now...

I don't get nostalgic when I use my Atari 130XE to program some things or what, or take a look at my BBS. This is cause my systems are used about every day or so. I get more nostalgic when joining an Atari 8-bit meeting, with a room full of 8-bitters that are actually used and not owned by people who keep them just for nostalgic reasons and use another computer to emulate the thing.

I don't say it's wrong to collect for nostalgic reasons or use an emulator. It's just that about every topic is about emulators and .ATR images, about how to convert them, how to format them, or how to build a "better" new computer, how to emulate this, how to emulate that, etc. What's wrong with the original Atari 8-bit hardware? Many people seem to forget there was a thing *before* the emulators, namely a real computer...

Don't get me wrong. I also have Pentiums laying around, and am using A.P.E. to transfer ATR images if I need to, but rather talk about the 8-bit side of the SIO2PC interface in stead of the other end of the cable...

My $0.02

Yes, but the 8-bit sound is better. The same went for the ST version of
Ultima III and the 8-bit version of the same. The 8-bit sound was just
dynamite.

Well, I set Emulation to STUPID and forced Ultraspeed to 1, and all is well and I can access my ATR's consistently.

I tried the cable theory, but going to a shorter cable made no difference. Maybe this specific Compaq 486/66 has a dump/slow serial port. I know I've used this model in years past (just not this particular PC) without any problems.

I'm going to try swapping the equipment.

Regarding my ATR's, I access them from a Windows 2000 server this 486 is mapping a drive to - and they're backed up to tape nightly.

Good idea though on the write protect.. hadn't thought about ATR corruption.

^^^^^^^^^^^^^^^^^^^^
> because the OS dont offer services/drivers I do see a problem using it for a mainstream home OS.
> Do you think linux is not on everyone computer because of marketing only?!?!?

Um, you're using XP... You're whole operating system IS beta.

Anyway, it's the hardware manufacturers job to provide drivers, not the OS. Any hardware worth having works in linux for the most part.

You don't NEED to recompile linux, some people do because they CAN, with linux you have that option. With windows you must upgrade or format and reload to implement new features. I didn't need to recompile linux to support ICS, but I did need a new copy of windows. I didn't need to reload linux to support fat32. but I did need to upgrade to rev-b95 windows. Same goes for USB, with windows you had to replace the whole OS to get that functionality. Firewire, ect, same thing there... you were saying?

And yes, the biggest reason people use windows is marketing, it comes with the computer. XP is nice, I'm using it right now (RC1 2505), but I wouldn't trust it to the extent I trust my Progeny Debian box. Heck I wouldn't even have it if it wern't for this MSDN subscription (another thing MS did right).

The only technical superiority Microsoft Windows has over Linux is the Gaming SDK/DirectX, which is incredibly good. No matter how much someone likes to bash M$, they still have to agree.

Your/My Win XP doesn't support 64bit, so again here comes an upgrade and/or format and reinstall. not on my Linux box! Rumor has it XP doesnt handle 64bit PCI very well either (was looking at that dual athlon board). In learned MS fashion, we "need a newer version"

I take a sheet of copy paper and fold it till it fits the cart slot snugly.
Then I spray the fold with tuner /contact cleaner, or in a pinch dip in
alcohol. A few up-down motions cleans the contacts.

Are the IRC #atari8 chats still active? Are there regular schedules for having atari 8bit oriented chats? If so, when and where?

Also, is there a recently updated dial-up and/or telnet accessible 8bit oriented BBS listing anywhere to be found?

Message-ID: <9j33kl$kk51b$1@ID-60478.news.dfncis.de>
Source record: 35388

Jeez, where do I jump into this fray?

I just got a fax today for a Dell closeout Pentium 266MHz, 32MB Ram, 2.5GB hard drive machine for $299US. That'd be one hell of a machine to be an Atari disk server through SIO2PC or APE, don't you think?

Let's get real, folks. Today's currency buys a whole hell of a lot more machine than it used to. Never mind the fact that Microsnot has screwed the OS market. Just imagine what the world would be like if yesteryear's 6502 programmers had interred the philosophy of code efficiency in today's 80x86 market. To quote the Tootsie Roll slogan from the same time period, "The world may never know."

Long live Atari!

I also had this problem, I was using the Amiga monitor that is the same as the 1084 form CBM. Did you make a 4 line monitor cable? LUM/VIDEO/CROME/SOUND Im asuming that the 1084 has all the ports on the back, if so you can plug crome into the video jack or just switch around the 3 video signals on the monitor cable. Its been 15 years since I did this but I do remember I was able to get color and or No artifacting by switching the video signals. It realy depends on the monitor cable you have?

You may want to find a cheaper Magnavox RGB 80 at you local thrift shop, there are 2 models, 1 has a comb filter!! and one dont, both are GREAT but if it has the comb filter you will get GREAT deep color.

It was a similar type of hardware in that it was produced in very low
volume and had no "standardized" parts in it, thus the individual
retail price was very high.

(Of course, in those days there really was little that could be called
"standardized", I admit.)

Most of the suggestions proposed here have been great from the "gee
whiz" neato aspect, but I really doubt they could be realized for the
target price, especially considering the overall sales are undoubtedly
going to be very small.

>A sensible approach would be to use SDRAM DIMMs for memory. I've seen

That would be great, of course. Those features don't seem to have
been very widely considered though, considering many of the
suggestions so far.

Well, Newark Electronics has the slower 20Mhz version of the 68020 for only about $65 each, but they only have 65 of them in stock.

I checked the 68020 and 68030 because those were suggested in several of the messages discussing Memory Management.

The 68000 requires an external MMU, taking up more real estate on the motherboard and adding cost to the basic cost of the CPU.

Having lived through the "OS in ROM" with the Atari ST, it can be a "double edged sword". It WAS great to have the OS boot almost as

fast as you could blink.

Unfortunately though, if there were any bugs in the code, (HA.. IF)
you were stuck with them until the manufacturer could get around to
first finding them, then fixing them, then finally producing a new
version, then distributing them, then finally you get to open your
machine and manually replace them.

With Atari, that manufacturing cycle took about as long as the useful
life of the computer. It's far more difficult than releasing a
"service pack" on disk.

And, the cost to the end user was ridiculous.

(Of course, it DID generate a nice little "cottage industry" for
programmers to come up with fixes and patches while waiting for the
"official" ROMS to finally appear.)

Do you really want "Mom and Pop" $300 computer buyers to have to be
prying ROMs out of sockets and jamming new ones in?

Actually what I always thought Atari should have done with the ST was
to put the OS on a cartridge. That way they could issue updates which
could be swapped as easily as changing a game, and the old cartridges
could be returned in the same shipping box for a credit. Sort of like
deposit soda bottles.

Only problem is, it would add $$$ to the cost of the original unit.

(Cartridge shells, cartridge pc boards, sockets, bypass capacitors,
possibly buffer chips, EPROMs, socket for the motherboard, tooling for
the computer case, etc.)

When we would suggest improvements in the ST, Atari would whine about
the cost. For example, sockets for the memory would have made RAM
upgrades very simple, but they told us that would add $25 to the
overall cost of the original computer, so sockets were out.

>
>Byron.
>
>[*] Come to think of it, wouldn't flash memory have a write enable line? If
>so, a manual switch or jumper on this line would be a suitable alternative.

Yes, FLASH RAM would be workable, but... you'd also need a boot ROM
with the read/write routines for the FLASH update in it. Otherwise,
one hiccup and your computer's OS could be toast with no way to fix
it. Just like blowing away a motherboard with the wrong BIOS
upgrade. And of course, add the cost of the boot ROM and
interfacing.

All of these are black and white by design - run them in emulator with artifacting off. On NTSC, using _COMPOSITE_ signal, the fast black/white transition makes TV think it's color information - this is called artifacting. Doesn't work on PAL (color carrier is higher - 4.43 MHz), so we've never seen it in colors. Also it doesn't work when using separated video (chroma/luma).

Hi all,

As though following this discussion at a computer newsgroup I would like to follow the idea of some others:

What might be the purpose of this $300 machine?
What kind of task does it need to be prepared for?
By what features might it be sold? (What is the difference to existing systems ranging from gaming consoles to standard PC?)

While scanning through all the answers I picked out one topic pointed out several times:
it has to be userfriendly - that thing must be some sort of plug-it-in-and-there-you-go...

I consider that it should be some kind of entertainement-station looking like the typical audio-hifi-stuff. There has to be the possibility to run all kind of media: from CD, DVD, to internet-based-information (including connectivity for VCR, TV, ...).

Concerning the OS I am not sure if something capable of what I am thinking already exist: the GUI must be designed the way that even the unexperienced generation of my parents (~ 60 years) will be able to use it from the beginning: Putting in some media must make the thing behave like the very same machine they are used to. A DVD-movie must change the display to some kind of "VCR"-display with touchscreen-buttons and moveable-regs ...
Or feeding it with a electronic lexicon must change the display ... to some e-book like view, where it is straightforward to turn around "pages" or flipping over to the relevant part of the book.

Saying it short: fit it to the typical living room equipment, close to the TV. Prepare for all kinds of computer periphals and home equipment (coffee-maker, fridge ...). Integrate phone, fax, mail, sms.

To be discussed,
Helge

Another comment.
If I take my US dblr 1050 out of the chain, and hook my 10 foot
14c89 cable directly to the computer, I get APE+ 3x speed just
fine. So, be sure to write protect your boot disk, any disk you aren't
writing to, and keep copies of .ATRs someplace else.
If you want to copy a real disk from a real disk drive, you may
have to use 1x 'STUPID' mode, with the APE cable chained from
the drive.
On another note, I can't quite get '850 emulation' to work. But
that's another small thing I'd like to do. It almost works, but
not quite. I mean actually using the PC modem and BobTerm.
But here we're talking a 10 foot APE cable and a 6 foot serial
cable to my 56700 modem. I think I can get a 14400 modem
to work. I know I can get a 2400 baud modem to work.

The address space of the 286 was 24 bit, although those 16 MB of
memory was addressable only in protected mode -- in real mode, the
286 could address 1 MB + 64 KB.

One word: artifacting

OK, more words....
Many games for the Atari were designed by people who wrote the games first for Apple computers which had no player/missle graphics. So they used Atari's highest resolution mode and played with bits to get animation. This Atari mode uses only one hue and two luminences. On a high resolution monitor, that's all you see, but on the older low resolution NTSC monitors and TV sets, you get "artifacting". Instead of white dots, you get green ones or purplish ones or orangish ones and even white if done right, depending on different combinations on the scan line. The first time I did a graphing program and got all those colors, I wondered what went wrong before I learned about this "bug", which clever programmers used as a "feature" to get lots of colors in this otherwise color-limited mode..
How's that? :)

I have DOS 2.0, 2.5, and 3.0 and am based in Durham NE England. If you email contact details I will send the disks.

I do not have any spare leads however

I have just pulled all of my Atari stuff (800/800XL/410/1050x2) out of the loft since I now have the space to set it up and am still looking in wonder at all of the games I had amassed all those years ago.

helgetu (h.schaefer@tu-bs.de) wrote:
: What might be the purpose of this $300 machine?

It was originally targeted for computer hobbiests. Given the groups we are posting to, it would share some of the characteristics of the 8 and 16 bit machines of the 80's, or would suit the tastes of the current users of these machines.

I was thinking of something easy enough for an amateur to understand the electronics, and low level programmaming of the device. (My view is that modern machines are too complex and too poorly documented to fit this market.)

: By what features might it be sold? (What is the difference to existing systems
: ranging from gaming consoles to standard PC?)

Any computer would have to be differentiated from current PCs, game consoles, and PDAs in a *significant* way. It would be next to impossible to compete in the present computer/entertaiment industry with a product which the big guys view as viable.

: it has to be userfriendly - that thing must be some sort of
: plug-it-in-and-there-you-go...

User friendly is a very vague notion, because what is obvious for one user, will appear to be counter intuitive to another. Particularly so if you are attempting to differentiate yourself from current products. Also, there are different levels of user friendliness: easy to learn, vs. easy to use; also, I view current systems as being difficult to program (too much so if you are not a professional programmer). Older systems were much better in this respect. As an example: it was easier to put graphics on the screen in the olden days. With the Apple II you simply switched to the appropriate video mode, then drew lines or pixels. There was no windowing system, or complex event manager, to mess with. On modern systems, you need to obtain special tools (such as ghostscript) to create programs incorporating graphics -- in any reasonable manner.

: Concerning the OS I am not sure if something capable of what I am thinking
: already exist: the GUI must be designed the way that even the unexperienced
: generation of my parents (~ 60 years) will be able to use it from the
: beginning:

A nobel idea. It is not the suggested market, but you certainly have ideas worth exploring.

: Saying it short: fit it to the typical living room equipment, close to the TV.
: Prepare for all kinds of computer periphals and home equipment (coffee-maker,
: fridge ...). Integrate phone, fax, mail, sms.

Integrating too much stuff in one device can complicate the life of users.
So, while a fax/mail/phone device may simplify communications, and a DVD/CD
device may simplify entertainment (particularly given the physical similarity
of the media), a DVD/CD/fax/mail/phone device is going to present too many
dissimilar options to the user. IMHO, that is one of the reasons modern
computers are not very easy to use. Better to use the old stuff, where the
computers did computerish things (interactive entertainment, or content
creation).

Byron.

Well,
actually just playing around with my A8. Not doing much serious stuff.
so, thats what I do (most of the time):

- converting software (texts, gfx, msx, etc.)
- playing software (games)
- using PD tools/apps. (shareware, freeware, PD)
- watching+collecting demos
- collecting software and hardware
- writing boring texts and articles...

and that`s what I don`t:
- collecting commercial tools, utilities and applications
- collecting or using anything on the A8 that has to do with a printer
- programming in any language (I cannot program anything!),
10 ? C64 is #*"§%$z 20 Goto 10 30 RUN RUN (my best program so
far)
- music editing or programming (I am not a musician, I cannot
read/interpret notes, I do not have any knowledge about music editors,
etc.)
- painting or drawing (I am not at all an art man, I cannot paint or
draw any good pics, not on paper nor on the computer)

I demand that Bob Retelle may or may not have written...

[snip]
> Having lived through the "OS in ROM" with the Atari ST, it can be a "double
> edged sword". It WAS great to have the OS boot almost as fast as you
> could blink.

That's easily enough done on this Risc PC, should I need to do so. However, it's better to let it run its boot sequence so that disk-based resources can be located and initialised.

> Unfortunately though, if there were any bugs in the code, (HA.. IF) you
> were stuck with them until the manufacturer could get around to first
> finding them, then fixing them, then finally producing a new version, then
> distributing them, then finally you get to open your machine and manually
> replace them.

Or you might be able to load patches or replacement modules or even a whole ROM image. Two of those apply to this machine, and yes, there was a short while before I got hold of RISC OS 4 ROMs when I was softloading a version of the OS...

[snip]
> (Of course, it DID generate a nice little "cottage industry" for
> programmers to come up with fixes and patches while waiting for the
> "official" ROMS to finally appear.)

That happens in the RISC OS market to a small extent. Of course, it helps when the OS supplier can and does release patch archives (or "service packs").

> Do you really want "Mom and Pop" $300 computer buyers to have to be prying
> ROMs out of sockets and jamming new ones in?

Probably not... flash ROM is finding its way into new machines and onto some hardware upgrades; there is a StrongARM processor card which has this.

> Actually what I always thought Atari should have done with the ST was to
> put the OS on a cartridge.

Maybe...

> That way they could issue updates which could be swapped as easily as
> changing a game, and the old cartridges could be returned in the same

> shipping box for a credit. Sort of like deposit soda bottles.

Or you could keep it and sell it on to somebody who hasn't upgraded to *that*
version, never mind the current one. Although that's almost as easy with just
the chips themselves :-)

[snip]
> FLASH RAM would be workable, but...

Flash ROM, surely.

> you'd also need a boot ROM with the read/write routines for the FLASH
> update in it.

True...

> Otherwise, one hiccup and your computer's OS could be toast with no way to
> fix it. Just like blowing away a motherboard with the wrong BIOS upgrade.
> And of course, add the cost of the boot ROM and interfacing.

Not to mention if you have your mass storage on a third-party interface card
which has its own on-board firmware, which the OS will softload or access
directly and which is probably itself in flash ROM... although in this case,
a floppy with the firmware and, optionally, a flash programmer for that card
would do.

Vintage Computer Festival East 1.0

Vintage Computer Festival East 1.0
July 28th through July 29th, 2001
10:00am to 5:00pm daily
Best Western Royal Plaza Hotel & Trade Center
Marlborough, Massachusetts, USA
The first Vintage Computer Festival East is being held on July
28th through July 29th at the Best Western Royal Plaza Hotel & Trade Center
in Marlborough, Massachusetts.

The speaker sessions begin at 10:00am and end by 2:00pm, and the
exhibit and marketplace open at 2:00pm and close by 5:00pm each day.

Admission is $15 per day for speakers, exhibition and
marketplace, or $10 per day for exhibition and marketplace only.

Please select one of the links on the right for more
information.

I modified my 1050 drive with something like Happy, but more versatile. It
was a hardware mod that, with the software provided, you could make all kinds
of bad sectors, custom tracks with custom sectors, and you could back up any
copy-protected disk. It would read the disk, determine where and what type
of bad sectors and tracks, then reproduce them on the copy. I always made
several backups for the exact reason mentioned above - all my A/R disks would
wear out!

Sad thing is, I forgot what the mod was called!

Bill

How about Transmeta's Crusoe? This would outsell everything mentioned
thus far I guarantee it. It can emulate anything, including x86 at
native speed!

Can you imagine UAE ported to Crusoe as its code-morphing layer?
incredible.

Modules could be made for just about ANY old school CPU/platform, and an
OS wouldn't need to be developed for it, as it could run these platforms
OS's natively, maybe even in addition to a custom OS.

Marketing would be a piece of cake, as you could use it from anything
from a Kiosk to a webserver, an Amiga emulator to a Unix portable.
Webpad's, PDA replacements, hardware controllers, you name it, this
thing would be /versatile/!

And the best part is it's /current technology/. Face it, if it can't run
Half-Life or get 200fps in Quake, your only buyers will be the people
currently reading this thread. :)

Linux Geeks would love it! (if only because Linus works for transmeta).
Slashdot would pimp the hell out of it, you wouldn't even need to market
it :)

Hell, I'd buy one and just run it as my mail/webserver and
router/firewall. transmeta already has a custom linux distribution
available for it. Not only that, but it could be offered in several
packages, you want WinXP on it? No problem!

The market could even be expanded to commercial vendors, it would be a
viable replacement for say, the hardware TiVo uses now. Cable
descramblers, Sattelite receivers, hell, I can think of very little
you couldn't make this thing do.

R&D required? very little, the hardware is ALL standard, and already
made, produced, and sold, not to mention it already has HUGE "geek
mindshare."

--David Ogg
Then again, maybe not?

I dont think thats true. The transmeta chip only deliver a fraction of the performance
of a core like the thunderbird at the same mhz.
And you can go in a shop and buy a single chip for under 90$ (the 1.2 gigahertz part).
But then you can get a 750mhz similare core (Duron) for 25$... thats your price.
I dont see the point in using a much slower chip like the transmeta crusoe for a
desktop/booksize PC.

just to give you an idea, a crusoe TM5600 600MHz running at max power usage deliver
46 sysmark2000 , a 500mhz P3 laptop deliver 115 sysmark2000.

Their is already so many core running on the x86... From the most obscure to
C64 & amigas.

X86 would be a better choice at all level... Unless this is for a PDA form factor.

Computer do alot nowdays in term of multimedia because of the power they have.
I'm not so sure intel/amd etc.. just develope for people to run half life at 500FPS.

Why would you want to pay for low performance?
Run x x86 version of the major OS... run Ti calculator or c64 class stuff under emulation.

>

You would need native code to do software encoding on that chipat a decent speed.
Who would write all that code?

>

Cant that be said for the x86 platform?

Stephan

That's interesting- the MMU in my Atari ST (68000) was one of the
fairly easy "hack" points where you could physically attach memory
expansion cards, since all the address lines were available.

I don't know if Atari used an "off the shelf" Motorola part though.

The reason the ST was limited to 4Mb of RAM was that the MMU only had
enough address lines for a max of 4Mb.

(Atari folks loved to poke fun at PC folks and their "640K" limit-
right up until they tried to put more than 4Mb in their STs. Same
situation- the company "knows best".)

The case has a couple of inches less depth (front to back). noticable by the position of the cartridge port. So the PBC will be different, so will the case. However the main chips will be fine.

You can use the keyboard (it's the same), but not the case. The case of
the 600XL is smaller than that of a 800XL.

So long,
Thomas

4506. Why it is not possible to copy some ATRs to 5.25 DISKs?

Maybe try formating the destination disks as single density first.

I'm not familiar with the software but i'm lead to belive that the ATR is an image of the entier disk, so there may be problems saving a single density image (88-90k) to an 'enhanced' density (127k) disk? Can anyone confirm my suspicions?

I had a copy of Drelbs and it required a translator disk to work correctly
on the XL/XE computers. It is a bizarre game, and the only way I knew what
it was called was the name of the file on the disk.

I had the same problem and here is my solution, some ATR's have been abbreviated by having the empty space deleted or not written at all. Hence the image is smaller and not recognized by APE. What I do is boot up Diskey disk editor on my emulator and then I do a sector copy of the ATR to a new one. You'll get errors when it hits the empty spots but just let it finish and the result is a usable ATR. I found the best way to create a good blank ATR is to just copy and paste one of the DOS ATR's and format it in the emulator.

Should not change the situation any as it is not the 1050 generating the error.
It must be the image or the PC program causing the trouble.

Putting 90K SD data on a 130K ED disk is transparent to the system; the 1050
drive will auto-set the SD/ED configuration when the disk is inserted and the
controller will write sectors 1-720 and ignore the others out to 1040. For
example, the 1050 controller knows that sector 19 is first data block on track
one in SD and 19th data block on track zero in ED and places them in the
correct sector number locations.

I have compiled a list of the joysticks and other misc control devices that
I have to dispose of just for the price of the postage to wherever you are.

Rather than post it here, please e-mail me at joystick@spheroid.demon.co.uk
for the list.

I am putting name stickers on the items that people have already requested
and will contact those individuals on Saturday or Sunday to finalise how to
pay for the postage costs.

4515. Re: Is the memory the only difference between 600XL and 800XL?

Newsgroup: comp.sys.atari.8bit
Date: 2001-07-19 19:25:49 UTC
From: canadiancoconut@my-deja.com
Message-ID: <507cbf9e.0107191125.10e2f7a8@posting.google.com>
Source record: 35337

The main differences electronicly, is 600XL has 16K and no audio/video out. To upgrade the 600XL to 64K I replace the two 4416's with two 4464's. When I use to do factory authorized repairs here in Canada I used this little program to test the CPU Sally and Antic together. When you allow this program to run continuosly on any Atari XL, if it would freeze then most likely the CPU was not up to spec.

```
10 PRINT " Hello ";
20 GOTO 10
```

Does anybody have TRS-80 Color Computer equipment for trade. I have massive amounts of ATARI parts 8bit and 16bit. I even have a working 1200XL. I made a BASIC cartridge for it by copying the 800XL BASIC ROM. When I got the 1200XL it had a faulty boot ROM. Ask for your needs and I will check the stacks of about 30 boxes of ATARI, Commodore, TI, and Nintendo NES stuff.

Ahhhh, so that's why with DR-DOS 6.0 or MS-DOS 6.0 you could load DOS high!!
I didn't know about the extra 64K (rather, I didn't know how you could use 64K of the remaining 15 megs of protected mode.)

Source record: 35344

peek(560) + peek(561) * 256 will give you the address to the display
list. the display list will end with a byte value of 65 which means
Jump and wait for VBLANK. The two bytes after the 65 will indicate
the address to jump to and wait for the VBLANK. Calc that address the
same way (lobyte + hibyte * 256).

Source record: 35346

Hi all,

Does SpartaDos 3.2d support a 130XE 576K upgrade ramdisk?

The reason I ask is because I decided to play around and upgrade a 130XE w/
320K I had laying around. It worked prior with SpartaDos 3.2d setting up a
256K ramdisk.
After the upgrade, I get a 128K ramdisk, regardless of switch position. The
switch does turn internal basic on/off though.

I just need to know if I did something wrong with the ram chips or if
perhaps my version of spartados and rd.com are confused by the 576k.

Thanks a lot,

David

I have a 576k upgraded 130xe, and it works with SpartaDos 3.2d and
SpartaDos X, etc.

You need a specific ramdisk handler to get to that 512k memory. I can
send it to you..

Of course it is; that key is just a switch. The tricky part will be finding where the circuit is broken; key switch mylar, along the traces, or motherboard connector. If only that key gives trouble, odds are the mylar has a piece of grit preventing contact..

I have never had an XE apart, but the XL can be disassembled and cleaned; it is just two mylar sheets with a conducting film trace on each side. Pressing the key squeezes them together to complete a circuit unless something keeps them separated. The XL function keys are isolated from the main keyboard and easily cleaned; just be careful of all the tiny little springs between the key bottoms and mylar.

Hopefully the XE is similar enough; remove the screws on the bottom of the case and gently rotate the top with keyboard up and over until it lays upside down beside the case with the mylar ribbon still connected. Look it over and make your decisions, and some detailed notes of how and where things fit.

Several screws secure the keyboard to the case top and even more hold the keys assembly together. The mylar connector is somewhat fragile; it has a limited number of reconnection cycles available, so be cautious. Alas, you will probably have to unplug the keyboard mylar and ground strap to proceed; then remove and disassemble the function keys module with key tops down to hold springs, clean between the mylars with air or small brush or lint free dry cloth, align pins and holes in mylar and reverse the steps to get it all back together. Carefully adjust the key placement to the case top to avoid dragging or sticking keys; this took me several tries.

If this offers no improvement, things become more difficult. Finding a cracked or scratched trace is tedious, but paint on repair is available. Lance at Atari Sales and Best Electronics both have replacement mylars and keyboards, I believe. The original 800 had a real switch and real wires for Reset so you could tap into it with a SPST or momentary contact replacement; making those connections is much harder on the XL/XE.

don, adross.

your sta 0,x
sta 0,y

Uhm. I think that would store the accumulator in 0 offset x and y.
You don't want to do that.
You can't just sta values into the display list. You first have to turn
off Antic (lda #0 sta 559 I think). Then you'd have to change the
DL, then turn Antic back on (lda #32 sta 559 I think.)
It isn't that hard to mess with the Display List, but a little involved.
Actually, you can make a custom DL, then turn off Antic, point 560
561 to your dl and turn antic back on.

I wrote a BASIC program to make a custom DL and then make a
BASIC LISTed file you could ENTER and use the custom DL.

It's not too friendly, but if you want it, lemme know.

Here's a description I just wrote of how to use my BASIC program:

dlmaker isn't too friendly.
What you are doing is making a custom display list.
You first decide how many 'segments' your dl will have.
You then enter the graphics mode you want, and number of
lines of that mode, for each of the segments.
You have to keep track of the total number of scan lines
your dl has. It must total 192 when you are finished,
or the program will start over.
After you have 192 scan lines in your x segments, the
program will display a sample screen using that dl.
Hit <ESC> to print something in each segment. Then
if the dl is satisfactory, the program will LIST
a BASIC file to disk, you give drive#: and filename.ext.
You can then use the LISTed program to use the dl
you've made. Your program must first GOSUB 10500 to
set up the DL. Then you put the 'segment' # in a
variable 'DL' and gosub 10700 to actually print or
draw something in the 'segment' of the dl you want.

Let's say you are ignorant = uninformed or not educated.

First you must understand the commands in the display list which is just a program for the Antic chip to use generating the screen; the number at PEEK(560) + 256*PEEK(561) is the memory location where it starts. The 1st three are usually 112 = blank lines; followed by the mode load memory scan and screen memory address. You can PEEK at the list to see what it is doing and POKE to make your changes.

Check De Re and also the section at 560 in Kevin's Mapping:
http://www.atariarchives.org/mapping/

i KNOW all that. and i know how it works in basic. but my problem is,
that i don't know how to do it in asm.

normally i would make a new display list, and just set the isplay list
pointer to that new location. but i would like to change something at
a memory adress, which is stored in x and y. that's my problem.

Ok, let's assume the high byte is in register Y and the low byte in
register X. In that case, to modify the display list base address:

```
STX $230
STY $231 ;this is just hex for 560,561
```

To address the first byte of the display list, you could use the following:

```
LDA $230
STA $F0 ;temporary storage in the Z-Page, let's assume it is
;available
LDA $231
STA $F1 ;and the same for hi again.
LDY #$00 ;offset zero
LDA ($F0),Y ;get the first byte.
...
INY ;prepare for the next byte...
```

To modify the first command of the display list (should be $70, "8 blank lines")
the above plus:

```
LDA #$60 ;say, 7 blank lines
STA ($F0),Y ;modify the byte
```

Greetings,
Thomas

We may need a little more info about what exactly you are attempting...

That indirect addressing you used stores whatever is in the accumulator into the address calculated by adding the zero to contents of the index (x or y) register; it will have no bearing or relationship to the display list at 560-561.

If you want to use indirect addressing, try a zero page indirect indexed as follows:

```
SDLSTL = $230; 560 decimal shadow display list low
POINTR = $CB; & $CC some free zero page pair of locations
LDA SDLSTL
STA POINTR
LDA SDLSTL+1
STA POINTR+1
LDY DLBYTE; which DL byte to alter
LDA NEWBYT; new value for DL
STA (POINTR),Y; put it where you want it
```

more efficient way is similar, but with a loop and a table of new values:

```
MORE LDA (TABLE),Y
STA (POINTR),Y
DEY
BNE MORE
```

```
or just LDA #TABLE&$FF
STA SDLSTL
LDA #TABLE/$100
STA SDLSTL+1
and point 560-561 to your new list...
```

Yowere correct about the misunderstanding.

First determine two unused zero page locations like $CB & $CC, put X (say it is
the hi byte) in $CC and Y (low byte) in $CB and then:
LDY #0
LDA YOURDATA
STA ($CB),Y
and YOURDATA will be put into Y plus 256 times X.

I guess I would suggest you build it based around the Timex Sinclair
ZX-80...That's worth $300, and it's really powerful too!

4538. Re: too stupid for asm

Newsgroup: comp.sys.atari.8bit
Date: 2001-07-20 22:18:57 UTC
From: Russ Gilbert <russg@en.com>
Message-ID: <3b58e624$0$62153$4c5ecdc7@news.erinet.com>
Source record: 35263

There's a couple text files tutorials on assembler at my site:
http://www.en.com/users/russg

Look at the assembler stuff.

You sound like you just want to put values into the existing graphics 0
display list. You say you know how to make a custom DL in BASIC.

I'm trying to remember. Seems like you should close the E: and open
it in GRAPHICS 8 to secure plenty of room for the DL and screen memory.

A BASIC program might go like:

```
10 DL=PEEK(560)+(256*PEEK(561)
20 POKE 559,0:REM TURN OFF ANTIC
30 OFFSET=20:REM SOME OFFSET INTO THE DL
40 POKE DL+OFFSET,15:REM PUT A LINE OF GR 8
50 POKE 559,32
```

```
ASM:
10 *=$600
20 SDLST=$230
30 LDA #0
40 STA $22F
50 LDX #20
60 LDA #$F
70 STA SDLST,X
80 LDA #$20
90 STA $22F
```

I'm rusty, but the two are the same, I hope. To make an executable
you have to put

```
100 *=2E0
110 .BYTE 0,6
```

4539. Re: too stupid for asm

Newsgroup: comp.sys.atari.8bit

Message-ID: <3b58ebfc$0$62140$4c5ecdc7@news.erinet.com>
Source record: 35266

I knew I'd make mistakes. I tried stuff with xlit and BASIC.
I had 32 to restore Antic. It's 34.
Also I'd suggest a line of 'E' 14 instead of a line of 15 GR 8.
That'll give you a black line you can see.
Russg

4540. Re: too stupid for asm

Source record: 35269

I dunno why I get myself into this stuff.
My asm code was messed up.
The following works to put a black mode 'E' line across a graphics 0
screen. It uses indirect indexed addressing, which is what I think
you're looking for. This addressing has to be done on page zero
(0-$FF). The only place I knew available was $CB,$CC.

```
10 *=$600
20 LDA $230
30 STA $CB
40 LDA $231
50 STA $CC
60 LDY #20
70 LDA #$E
80 STA ($CB),Y
90 BRK
```

Then you need to design a 300$ box that kick ass compared to a 300$ PC, otherwise you lost before you even started pouring $ in R&D.

Make sense?

My best hope is Nforce/Duron for sub 500$ systems of really high design standing.

I think if the design can fit in a 6x3x1 inch format with a color LCD a few people would buy them. (Me included)
My casio PB1000 died, and I'm reduce to my 1liner PB100 .. a pocket 'amiga 500' would be a nice replacement.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

Urgh!

What does it say? I am guessing "(C) Microsoft Corp."

Would that be the BASIC ROM chip? I am quite sure Micro$oft wrote the BASIC
for it (and the Amiga, and probably the VIC-20).

Paul.

I just got a PDP-11. Those machines really *were* used for
controlling nuclear reactors. Amongst other things. Mine, however,
never did anything more glamourous than routing parcels for a
nationwide courier service.

4560. ATOS - a new GUI for the Atari 8-bit

Newsgroup: comp.sys.atari.8bit
Date: 2001-07-22 17:12:31 UTC
From: NoOne@FakeEmail.com
Message-ID: <90E6807DECTHEnterprises@205.212.123.11>
Source record: 35283

ATOS is a new GUI for the Atari 8-bit computer.

I've decided that it's time to open up the ATOS web site and download files to the general Atari 8-bit computer enthsusiasts. I would like to thank the beta testers here who have helped me with all sorts of suggestions and bug reports.

You are invited to check out the ATOS web site at:

http://cth.dtdns.net/atos/

I've also updated my main web page at:

http://cth.dtdns.net

Best,
Tom

Howdy Atarians!

Somebody knows the game "Elektraglide" ? It's one of the best and most colourfull Test Drive stylish game for the 8-bit atari. I did love it to play.

For a week or so, I've played it again with the atari 800 win emulator of this polish guy on net. It played best and is so exciting as always!!

But there is still a question to this game: has it an end?! I mean, I remember playing it and after a while the car just stops -> well it's not the clock, running to zero!! No, it just stops and game restarts.

what do you think?

Can you fellows on the east side of the Atlantic help me with an early 80s question?
When I was in grad school in Mississippi, I saw on the Public TV channel (several times) two BBC series on micro computers.

One was called (I think) The Computer Program, and the other was (as I recall) Making the Most of the Micro.

Each was 12-13 episodes long.

I've tried here, through contacts with the Nebraska Public TV to see if anyone has copies, or where I could buy copies. Do any of you know anything about getting old BBC programs on tape?

Both series had the same host (a Scottish surname as I recall) and covered a number of different machine, but esp the one I don't have and would really like to have: the Acorn BBC computer.

Thanks

Roy

Hi Mirko,

Sorry about the server outage. My wife was playing an online game on that system and it got hosed up for a while. It's back online now. How is ATOS different? Now that the server is back online the best thing might be to read all about it. The ATOS core is written in assembly language. It uses the object model at the conceptual level. The majority of the various accessories were written in CC65. Some were written in MAC/65. It uses overlays. It boots in Sparta but can read and write to the root directories of MyDOS and Atari DOS disks. There's still some rough edges to it, but I will keep working to improve it.

Best,
Tom

Ian McNaught Davies... With Chris Serl as his clueless "what's a computer"
type sidekick on the computer programme...

Alas. No. Can't gove you any pointers on getting copies. I don't know if the
BBC even still have copies of it.

You could always enquire to the BBC itself.

Here's another one: use a newsreader that uses a decent maximum
line-length, but you don't give a hoot for good netiquette, do you?
All you want to do is troll.

tin has versions for Amiga and Win32, but the former is a bit old and
the latter needs cygwin. Besides, tin is too un-Windows-like for
Stephan to use. He prefers to inflict Outlook Distress on everyone.
The worse it posts the happier he is. He'll be posting in HTML soon.

I haven't tried compiling a new version of tin under AmigaOS. It
might be interesting to try...

slrn 0.9.7.1 was fun!

> But then you can get a 750mhz similare core (Duron) for 25$... thats your price.

A notebook CPU costs more than that, heck I can't even find a price for
comparison. You just couldn't use one of those furnaces in a book-size
unit.

> I dont see the point in using a much slower chip like the transmeta crusoe for a
desktop/booksize PC.

But it would be a HELL of a lot faster than the 68000/Timex
Sinclair/6502 relics others are suggesting, and it runs without a
heatsink. You ever felt the CPU in a notebook? imagine the temp a

thunderbird would be!

> just to give you an idea, a crusoe TM5600 600MHz running at max power usage deliver
> 46 sysmark2000 , a 500mhz P3 laptop deliver 115 sysmark2000.

Thats under the x86 codemorphing layer with the optimizations set to
"don't cache code", The Crusoe is a tricky beast to benchmark,
especially against it's own codemorphing layer. The codemorphing tends
to cache the benchmark loops giving unrealistically high scores, so for
simplicity, it's turned off.

> > Can you imagine UAE ported to Crusoe as its code-morphing layer?
> > incredible.
>
> No so sure about that...

It would be wild, a codemorphing layer that abstracts a 68040, and the
chipset! come to think of it, I wonder if UAE would even be needed?

> > Modules could be made for just about ANY old school CPU/platform, and an
> > OS wouldn't need to be developed for it, as it could run these platforms
> > OS's natively, maybe even in addition to a custom OS.
>
> Their is already so many core running on the x86... From the most obscure to
> C64 & amigas.

But those are "emulators", Crusoe's codemorphing is a much different
beast, even x86 is just "codemorphed". c64/Amiga's are running on top of
Windows/linux on top of x86. The Crusoe wouldn't need a host OS.

> > Marketing would be a piece of cake, as you could use it from anything
> > from a Kiosk to a webserver, an Amiga emulator to a Unix portable.

And it looks like they beat me to it, it's now available, albeit at a
higher price, running linux 2.4.5 w/Netscape 4.7 (shudder)

> > Computer do alot nowdays in term of multimedia because of the power they have.
> > I'm not so sure intel/amd etc.. just develope for people to run half life at 500FPS.

On the contrary, they'll market them for dumber things, like Intel
saying it's "New Pentium 4 processor will enhance the web" and going
on about how the internet will be faster. I always get a kick out of
that :)

> > Linux Geeks would love it! (if only because Linus works for transmeta).

> Run x x86 version of the major OS... run Ti calculator or c64 class stuff under emu

Because emulation would /be/ low performance, the Crusoe running a
platform under codemorphing is faster than any emulator I've ever seen.
Show me an x86 emulator that can run Windows faster than the Crusoe can
under codemorphing/x86. Remember, this is a hobby box, if I want to toy
with an OS, I want to run it natively, (or a codemorphing facimile
thereof.)

Plus it's upgradeable (the codemorphing), meaning the platforms it can
morph will increase over time.

> Who would write all that code?

In the case of the Tivo, it's already been written. the Linux/x86
package is already available customised for the Crusoe, tailored by
Linus Torvalds himself. In the case of the Satelite reciever, you can
find the GPL'ed code from a link off of www.satmatrix.com. Kiosk
software has already been made available for the Crusoe under GPL, so
has PDA codemorphing for the Palm platform.

The beauty is, if code isn't available, as long as you can produce the
codemorphing layer, you just reuse your existing code! Case in point,
Windows. Windows doesn't run on the Crusoe, because the Crusoe isn't
x86, it simply pretends to be through abstraction via the codemorphing.
Hence Windows can run "natively" on a CPU it isn't written for.

> > R&D required? very little, the hardware is ALL standard, and already
> > made, produced, and sold, not to mention it already has HUGE "geek
> > mindshare."

> Cant that be said for the x86 platform?

Only for the case of x86 hardware meant to run x86 software, the Crusoe
isn't limited to x86.

As for the "Geek Mindshare" I think a Crusoe captures more mindshare
among the HW geeks than x86 does.

And the Ohio Scientific systems, and the Apple II and, and, and...

Actually the OSI BASIC was an excellent little interpreter. With only
6 digit floating point precision it was extremely FAST (who cares
about .000001 accuracy- I was just writing video games), it was
easily extensible and it only had a few bugs.

Those were the "good old days" when Microsoft was your friend.

Actually the 750mhz part should run 'cool', also you can run it at 400mhz and remove on
chip active cooling?.
I put 533mhz celeron in booksize computer and they where fine. a 750mhz duron would be
```

cake.

Yes, I would choose a rusoe over a 68000, no problem here.
For low power... I kind of like the strongarm.
I dont really have a sweet spot for transmeta effort, I dont see where it really fit in the
market.
I also see that they are not doing well at all... Could be riding the economic wave, or
just problem
grabing some of the cpu market.

>

In the end , MMX/SSE/multimedia/3d stuff will probably run many fold faster on a slower mhz
p3
then a crusoe chip.

At this point I would guess that a mobile p3 can render more then a crusoe using the same
amount of
power... Using less power ut performing less is not always an advantage.

Their is a diference betwen reformating code (UAE is already doing its own type
'codemorphing')
and doing cycle precisise timing on virtual register set of custom HW on top of that.
Their is alot more stuff in UAE then what transmeta is doing, thats why I never caught on
the hype.

>

Does codemorphing support handling of strobe registers? I dont think transmeta
support emulation of something as complex as the OCS HW register set.
The floppy controler register would need 'HW logic' emulated... etc... Not an easy task.
So you would need to show big revenue to spend all that R&D to emulate decade old HW.

It run flash smoother, it handle better codec like mpeg4 and real, complex web page scrool
smother, it will give higher frame rate in complex java gfx applets, etc, etc...
So in effect, yes the web to an end user look smoother/faster... He can navigate a bit
faster,
scroll complex page with ease.
Use a DSL conection on a pentium clasic and then a pentium4. If you visite media rich web
page you will see a Dramatic diference.

So I can see people getting a new computer when they get braodband.

What OS worth anything doesn't run native on a x86? :)
And how much power do you need to get z80, 6502, 68000, etc.. emulation going on
a gigahertz clas thunderbird?

>
> Plus it's upgradeable (the codemorphing), meaning the platforms it can

I dont think they have yet to emulate a pentium MMX, they just emulate the basic 486?

What codec did Linus code nativly for the crusoe?!!?!?
Do you have a link on what is in a Tivo box?

>
> The beauty is, if code isn't available, as long as you can produce the

Thats the whole problem... The chip is just to slow.

> Windows. Windows doesn't run on the Crusoe, because the Crusoe isn't
> x86, it simply pretends to be through abstraction via the codemorphing.
> Hence Windows can run "natively" on a CPU it isn't written for.

Like UAE convert 680x0 to x86. I can take a fresh copy of Amiga OS from a box and
install it on a PC.
The thing is windows will expect some kind of common PC chipset/bios support if
its to ru nout of the box... I dont see the point. Get a mobile P3 to run windows, it
will be faster. Support native MMX/SSE at full speed.

Aside hacking a new processor, or fiddle around... why would anyone actually
morph to something else then a x86?
For example, can the sony laptop also run MaxOSX with a PPC version of the crusoe code
morphing?

>
> As for the "Geek Mindshare" I think a Crusoe captures more mindshare

I'm a programming geek.. and I got loads of tools for the x86. I also love processing
power.
The crusoe is a just a processor that got its core designed to be emulator friendly... But
aside
emulation is doen't have much to it.

Again, I'm not a fan of that chip because I see no use for it in all common computing form.
PDA, laptop, bookside, desktop, workstation, server... All have better processor already
there for
the picking.

Stephan

Seeing as how the Atari can call a subroutine every 60th of a second, has anyone ever tried hooking up a pair of Sega Master System 3-D Glasses? It just has a stereo 1/8th plug and you simply alternate applying ??? volts to the left/right sides. i.e. block left side while showing right page/block right side while showing left page. I was going to experiment with one, but I had to sell it. :-(

you did a great job with your new ATOS! It's quite interesting to see
new software for our 8-bit atari computer. And after so long, as atari
officaly died!

As for downloading you 2Mb zipped atos-archive, I was very amused to
see a download constantly giving a rate of (and now: hold on!!!) 1042
byte per second!!!!

boah :-)

Why do people keep sayting this, i have a 600XL and it has the same
monitor connection (5 pin DIN) on the back as the 800XL - if it did i
could not use it cus i only have a CM8833 to view on.

Maybe the UK one DID have the monitor but i have heard a lot of people
and WEB sites saying there was no monitor connectino but there WAS/IS.

As I recall there are three circuits to choose from and each one 'forks' at a certain point, so there are six possible destinations.

I persevered with this game for hours and eventually managed to reach all six finish points (without cheating!).

As stated in the previous post the prize for all this effort is a brief increasing-pitch sound, a blacked out screen and then back to the menu. It was a bit disappointing, but as they say the fun was in the taking part. I can still remember physically ducking when one of those big boulders was bouncing towards me!

As an aside, I also thought "The Last V8" was pretty easy to complete but some people didn't?

yes ... too bad, because this is one those games, where the atari
version has much better graphics than the c64 port.

and thinking of Elektraglide could be a good base for doing a real
"Test Drive" on our small 8-bitties :-)

There's a game about drinking vegetable juice? That, my friends, is why
I so love the 1980's and Atari computers.

Real newsreaders even let you change the line length as you type.

Well, I guess that should actually be, "real OSs," since the key to
that is being able to change prefs on the fly while you use programs.

Multitasking: try to imagine it.

I may be late to the thread, but anyway...

I don't think that people will be willing to pay $300 for an appliance (as such a computer would be). You have to look at what the current market wants. There are a million and one Internet boxes (the Bush Internet TV is one at ï¿½79, or about $100) that do Internet, email, etc. Not much use for writing a letter or playing games though.

Assuming that you have been given a Government contract to make sub $300 boxes for poor people to enable the Internet revolution and increase education,etc (a realistic modern aim?) then what would you want?

Integration is the name of the game. So is simplicity. It won't have a DVD drive, but it will have a CD drive. It won't have a 40GB HD, but it might have end of line never-sold 5~10GB HDs. It will have built-in modem and ethernet. It will have built-in graphics and audio. It must display to a TV, but a monitor is an option. Expansion ports kept to a minimum (4 USB, no serial, parallel, etc). Internal expansion not necessary. CPU power needs to be adequate, not good.

If you are building 1m boxes, you would sign a contract with Asus/ABit/etc to get low end motherboards with the features that you want only, in the form factor that you want. Use a cheap processor (in quantity, the Via C3 would be good - I bet you could get 600MHz C3 processors in quantity for ~$25 each). Integrated motherboard would be $40 with a $15 chipset (SiS630) and minimal components. Hard drive would be ~$50. CD ~$20. No floppy.

Motherboard (+modem, network, audio, graphics): $40
Processor: $25
Hard Drive: $50
CD: $20
Case (custom): $20
Keyboard: $5
Mouse: $5

As for the operating system - a free one would make sense, however a simple for dummies interface should be employed. The Linux kernel

could be used, with a graphical interface that lets the user run applications and set up the device, but isn't a scary UI. Big icons on the screen, one for each application. Basically the Palm launcher I reckon. Modified applications could be used that didn't prompt the user about where to save the document, but just saved it safely, and when you wanted to open a document, it would just show the user the list of documents that they had previously created. Disable downloads from the Internet except from the device makers, where new apps can be downloaded only (use a special tool, perhaps).

On the other hand, just use a Pace Digital TV set-top box, with built-in PowerVR technology (a la Dreamcast). As non-digital TV will be eradicated in about 6 years anyway, why not lever a device that everyone will need in their house at one point or another?

A clockwork powered computer for the third world.

> That doesn't seem 'far too expensive' to me. Those processor rocks!

I would also say that this was a great processor for a device.

> > As OS? (Linux is a dead giveaway, but there also other OS's out there)
> Linux, why not. .. oh yea. You mentioned userfriendly. so thats a nono.

Linux is a kernel. The "Gnome OS" and the "KDE OS" are not
userfriendly enough! Get the Linux Kernel (or FreeBSD kernel, etc),
get QT embedded or GTK/Framebuffer, and create a custom, Palm UI like,
interface that is simple to use.

> > Amount of memory? (RAM and ROM)
> 256meg RAM. 8K EPROM

128Meg will be enough - $9 in bulk apparently. EPROM?

> > Graphic and Sound?
> Geforce2

Waaaay too expensive for a $300 device, unless you were going to sell
it for a $200 loss (XBox).

> > Network capabilities? (internet capable)
> 100BT

Part of most integrated chipsets anyway.

> > Plug in capabilities (remember you're making it as cheap as possible so
> > modems, CD-Roms, HD's are all extras)
> CDRW

Not for a $300 device. Depending on the market for the device, either
a DVD drive or a CD-ROM.

> Take a look at the XBox.

$500 of hardware sold at a $200 loss. With out-of-date processors
donated for free by Intel. The chipset alone would cost $120+ (if a
GeForce 2 MX enabled chipset sells for $90 [nForce], then a GeForce3.5
enabled chipset will cost at least $30 more - more like $50 more).
Motherboard is CPU, Northbridge, Southbridge, 4 USB ports, Ethernet,
Modem, and IDE channel - very cut down to reduce costs.

Source record: 35216

It should do for both...

1) copy Big 5 phone # from opening screen
2) hop up on the girder to avoid the mutant at the bottom of level 1
3) type in the phone #
4) now Shift + any digit (1 to 0) whisks you to that level 1 to 10. I have heard that if you are quick on the keys and execute it before you hit the ground, that Shift + current level can avoid death and save a life when free falling from an excess height.

>James E. King utah_lanman@yahoo.com asked:

Source record: 35218

The 600XL was described in official Atari releases as lacking the monitor jack.
This was confirmed in Antic and Analog reviews and all of the units I have
seen. Plus the video circuitry is supposedly incomplete on the 600XL boards
such that the monitor jack cannot be easily patched in.

Yours is rare unless Sunnyvale modified their plans for that market.

>Me georgezip@btinternet.com

"decades"? Slightly optimistic perhaps. Look back a decade. Find a
good software base. Is this still a good software base? No? I rest
my case.

> ROM is nice, but restrictive. Atari was hobbled by the difficulty of
> releasing bug fixes to its TOS operating system because the OS was in

Dodgy OS. If it was better designed, it would be able to have been
patched in software after the boot process. (see Setpatch)

I would love to. Could you please tell me if there is an equivalent vector in BW-DOS as the VCOMND vector in Sparta? From what I can see that is the only thing that would need to be changed to make ATOS compatable with BW-DOS. I haven't tried this yet, but there's a possiblility that a program could could accomplish the same sort of thing by intercepting control by first changing $a/$b to point to a command pre-processor.

Best,
Tom

I have a few 600XL's laying around, all WITH a monitor-jack on the back.
These are all PAL systems. I do know the jack is lacking one connection
compared to the 800XL (composite chroma?).

The problem is it's a niche market, albeit an expanding one. They don't
even plan to break even for 5 years. I don't ever see them taking over
any desktop market, however, for low-power applications with platform
legacy requirements, you can't beat em.

Oh, yea, no question about it, but then, this isn't a desktop machine
we're talking about. x86 on the desktop is king.

> At this point I would guess that a mobile p3 can render more then a crusoe using the same amount of
> power... Using less power ut performing less is not always an advantage.

Not on a desktop or server machine, but then thats not where any sane
person would dream of sticking one of these anyway. The goal is a
slightly higher platform abstraction, and slightly lower power

consumption.

Not any more than it took them to write the codemorphing abstraction for
x86, from what I hear, the x86 architecture was a real bitch with all
the registers they had to emulate, I think the reason they emulate a 486
is because those registers were documented. That was the reason NASA
gave for using the 486 as well, access to documentation. Transmeta then
had to provide a BIOS as well, as part of the morph abstraction.

A big part of the R&D has already been worked out by others already, I'm
sure AROS/UAE technology could be used. I know UAE is free under the GNU
GPL license, not sure about AROS.

Sure, but what they said was that the SIMD instructions new to the P3
would speed up DSP code, making software modems faster. I think alot of
people somehow thought that they could upgrade their dial-up connection
by upgrading their processor. ;) It's true the SIMD instructions do
include DSP specific instructions, but I doubt anyone would notice on a
dial-up software modem anyway, and I don't think the network card
drivers will benefit from SIMD at all, since there's no DSP taking place
anyway.

;) If it's meant to run Windows/Linux/Solaris ect. and sit on my desk,
give me my Athlon 1400/266 768MB DDR MSI-K7T-Master w/raid box anyday,
but this is a smaller, possibly battery-only portable hobby thing here
meant to be multi purpose webpad/PDA/portable what have you, it would
have to be very flexible in what you could do with it and where you

could bring it, so as not to become so "niche" that noone buys it.

The reason I see Crusoe as a good match for a project like this is that
it sort of combines a dozen or so pre-existing niche markets into one
market that could be sold the same hardware. There's already a market
for a low-power webpad, and people are willing to pay $2300 for them
(check out Slashdot's submissions for saturday) there's already a market
for PDA's, and Crusoe is faster than anything in most PDA's right now.
portable units for inventory and UPS/shipping are already being sold,
for anywhere between $400-$1000.

Hell, Transmeta's Crusoe, running at 633MHz, is already being used in
very-low power servers, running on 7 watts (idle) to 15 watts (max load)
http://www.transmeta.com/everywhere/products/servers/rlxtechnologies/rlxtechnologies_syste
m324.html

(this link may wrap, my newsreader sucks)

> What codec did Linus code nativly for the crusoe?!!?!?
> Do you have a link on what is in a Tivo box?

http://www.tivo.com/linux/index.html

They released their power-PC linux mods as per the GPL.
Since the mods were developed by TiVo themselves, they already have the
codec source, all they would need to do is recompile for Linus's
"Transmeta distrobution" (maybe not even).

If Transmeta releases a PowerPC codemorphing layer (or someone makes
one) they wont even need to do that. This would probably interest TiVo
greatly, as they already stated they wish to make their money from

selling the subscription, not the hardware.

> > The beauty is, if code isn't available, as long as you can produce the
> > codemorphing layer, you just reuse your existing code! Case in point,
>
> Thats the whole problem... The chip is just to slow.

yes for a desktop, but for the applications and the specs of this
project, it far exceeds what the alternatives can do, and will still be
in the "desktop speed ballpark", unlike a z80/68000 ;)

> > Windows. Windows doesn't run on the Crusoe, because the Crusoe isn't

> install it on a PC.

You mean you can install windows, install UAE, install AmigaOS, if you
were buying something specifically to do things like run AmigaOS, why
would you fudge around with windows? Heck, the best way to have a
desktop Amiga is to get an Amiga desktop anyway ;)

> The thing is windows will expect some kind of common PC chipset/bios support if

> morph to something else then a x86?
> For example, can the sony laptop also run MaxOSX with a PPC version of the crusoe code
morphing?

The Sony laptop was made as an x86 laptop, this project isn't about
making a Windows98 laptop, they exist already.

> > As for the "Geek Mindshare" I think a Crusoe captures more mindshare

>
> Again, I'm not a fan of that chip because I see no use for it in all common computing form.
> PDA, laptop, bookside, desktop, workstation, server... All have better processor already there for
> the picking.

The project needs something that can do them all, at whim. No general purpose device will ever outperform a specifically desined for a purpose device, thats why we use 1400MHz Athlons to play games and 33MHz Dragonballs to sync our palms. but neither one of those would be very good at both ;)

You can play Quake on a Crusoe, and still remain at only 2 watts. The same beast will run linux, and can scale down to less and be walked around like a PDA.

It's not something that would replace the desktop, but an extension of it, replacing possibly our webpads, mp3/Rio's, PDA's, pagers, inventory interface units, ect with a common device/platform. It might even slightly eat into the laptop market as alot of people only "need" a laptop for trivial things anyway.

This is now, OEM windows in 5 packs can be gotten from Ingram Micro for
about $80, and Ingram is one of those vendors thats usually more
expensive, but they have everything.

We used to be able to sell OEM Windows with just a Mobo or HDD, but now
they require a full booting machine (or parts that could make one)

Nope, it wasn't. The controller and a game or two HAVE shown up
in prototype form though.

It may have only done left, right, fire?? It's a headband that
reads the electrical impulses from your forehead/temples when
you "think" a particular direction (or just scrunch the muscles
on that side of the head).

I would start by moving the >desktop>wnd> directory and files to one of the
other drives. After that you'll have to edit the desktop.cfg file. In it
you'll have to change the "1" in the "drive for windows files" to the new
drive number.

If ATOS is complaining while it is running about "overlays" then you can
move the >desktop>overlays directory over to another drive. You'll have to
change the "drive for overlays" entry in the desktop.cfg file for it also.

You can save alot of space on D1: by moving the >UTT> directory and it's
files to one of the other drives. You'll have to edit the D1:>PATH.SYS so
that the "D1:>UTT>" is changed to the correct drive.

If you need more space than this then let me know and we can take another
look at it.

Best,
Tom

The x86 is nasty that way... its *backward* compatible that to make something 100%
x86 compatible take a huge effort. (I also admire AMD for this... and in turn Transmeta)

I'm not sure their is a market... but if their was, AMD could also make their processor
emulator friendly by adding so facilities to it.?

I dont think you will see benefit at that level (packet thruput). Maybe a tiny, tiny bit by using the cache control insruction. But nothing to advertize about.
The web is vague enought that intel can be doing this compain in reference to the execution of the web data received.

If it will run on batery forget what I said.... I'm intetrested in the strongarm, possibly crusoe native?
The second part here is compiler technologie.

I use to have a PB1000, a programable 'calculator'. Nothing like a TI... it was really like a small 8bit
computer... But it died. and if I could find a <300$ replacemtn I would jump on it.

How about the StrongArm? isn't it lower power and pack a nice punch?
For those device you dont really need code morphing unless you dont have the
right compiler tools.

That look massive! I really didn't think anyone would use that processor for server level
design.
Nobody would put that much $$$ in R&D without having studyed the market well...
humm. I must be missing something.

My original comment was about stuff outside the OS. For example software video codec.
You need those to run native to get realtime, usually assemby codec. So you need to man

power to get an mpeg2 decoder (encoder)...

>

I would imagine the best for them would be to reuse common PC parts?
Maybe a basic microATX MB modifyed a bit with a custom bios?

I would imagine that someone could build a 68000 today that consume very little
power and runned at high mhz?

How about the .9 volt .5 watt Mobile pentium3?
Or the ultra low voltage mobile celeron (with mmx/sse)?

The 600mhz part is not cheap, but its still under 150$.

I think its going to be very, very hard for transmeta to take this place.
But not impossible. If they can impose themself as the standart, then they can live those 5 years to get profitable.?

> Modem, and IDE channel - very cut down to reduce costs.

The xbox cannot cost 500$ for MS to build... the lose probably include all the QA, R&D it took.
They probably spend <300$ to build the xbox... its cheap stuff when you build them in the millions.

You can find some decent complete motherboard retail single unit for <70$ (Thats with audio, 32meg video, the works)
in a retail package etc.. Those probably cost 40$ to build. (Its not geforce2 based, but a Savage4 core.)

The nForce chipset in a year might cost <50$, and people will build <100$ MB using it... Anyway, I'm planning
on building a <500$ PC using this chipset when it comes out. So I'm sure a big manufacturer can build a PC
for 300$ mass produced.

In article <tlpsk6fkn0qj16@corp.supernews.com>, tthai@mindspring.com
says...

> The x86 is nasty that way... its *backward* compatible that to make something 100%
> x86 compatible take a huge effort. (I also admire AMD for this... and in turn Transmeta)

Heck, even Intel had a hell of a time with the transition from 486 to
pentium(p54c/p55c-mmx), they said there were something like 14 debugging
registers that were "left out" and caused a few problems, some quazi-ops
were dropped, and they had to abort those plans to support those
486"upgradeable" boards with the extra pins that were pentium ready.
(a small price to pay for feature-creep though)

At least the x86 legacy stuff does have an end in sight though, the
64bit CPU's won't be encumbered the way x86 was.

> I'm not sure their is a market... but if their was, AMD could also make their processor
> emulator friendly by adding so facilities to it.?

They could I suppose, but being the Athlon would do the abstraction at a
higher level, I don't know how much more effective it would be. (In a
desktop where you have watts to burn however, its a different story)

> If it will run on batery forget what I said.... I'm intetrested in the

> jump on it.

I miss the simplicity of the 8-bits, I held on to my Vic-20 for years
using it as a hardware controller for EPROM burners and whatnot. One
side of the room I burned them, and the other had UV lights to erase
them (remember those?;) My neighbors must have thought I was growing
pot.
What was so magical about our first 8bit computers that made virtually
everyone who owned them learn to program them, as opposed to today,
where people are so cynical about their machines? We used to "Love" our
computers in a way that won't happen again, it seems. Gosh, did I say
that? I sound like an old fart ;)

I'm totally in the dark when it comes to the StrongArm, I know it's made
by IBM and I hear they have a loyal following in Europe. That about sums
it up as for my knowledge there ;)

Actually I'm not sure if Tivo uses software or hardware mpeg, but
between Tivo and Transmeta, I'm sure they could whip something up.

Or even a retrofitted Sony laptop motherboard maybe (gawd I hate laptop
hardware though ;) microATX would be good, with video/sound onboard,
maybe using laptop IDE hard disks, External 'wallwort' powersupply,
internal battery.

They've got one thing going for them, noone else is after this market, it's currently dominated by hundreds of 'submarket' solutions, Palm, Rio, etc, and Transmeta doesn't even necessarily need to compete with them to controll this market, they just need to become the main vendor for the tribes currently camping there.

Then again, Intel might just decide to squash them.

4614. UK vs. US models

Yes, Both machines have the same voltage in, the 110/240 bits done in the
power brick, so get the relevent power brick.

Pal has a lower refresh rate and a larger area. You are likely to get roll
of the image and missing upper/lower areas of the display pal machine on
NTSC

Thank you for your info!
I've downloaded and tested it, may I upload it on my homepage as a mirror?

My impressions was the following:
-I think, ATOS is a different GUI to BOSS-X, the best thing is that it's not written in (Turbo-)BASIC
-ATOS, and it's ST-Mouse support is a great thing, but are joystick and keyboard also supported (the standard pointer devices for A8)?
-it's very nice, the there more than one choice to open a file, for exsample *.BAS-Files: here you can choose, if you want to start it in BASIC or in Turbo-BASIC, great!

What memory is needed or supported? Is it using a swap-file like Windows?

>I'd really appreciate a copy if so. Either a web address or email it to me.

Check out http://www.holyoak.com and click on Atari 400/800/XL/XE to find my 1MB upgrade. But beware, it still doesn't work on my 800XL (I just don't have the time), it works 100% OK on my XEGS though. Sepatare ANTIC and CPU access, no loss of software control over BASIC, OSRAM, Selftest or Missile Command (only XEGS's have Missile Command), no data loss due to bad refresh circuitry, no screen flicker, no obscure addresses used (just $D301).

Not really anything except for nostalgic reasons, I'd say. Ok, I'm using
it sometimes to burn EPROMs. The interface hardware of the Ataris is so
simple, it's easy to extend it by some self-made hardware.

So long,
Thomas

4625. Atari 8bit emulator for iPAQ (Linux)

Newsgroup: comp.sys.atari.8bit
Date: 2001-07-24 18:13:27 UTC
From: William Kendrick <nbs@bolt.sonic.net>
Message-ID: <bVi77.2039$P15.23925@typhoon.sonic.net>
Source record: 35147
Cross-posted to: comp.sys.palmtops,comp.sys.atari.8bit,comp.sys.handhelds

Jiri Svoboda has taken the source to "Atari800", an Atari 8-bit computer
emulator for Linux/DOS/Windows, and hacked it so that it runs well
on an iPAQ PDA under Linux.

http://c0r3.dsh.cz/iPAQ/atari/

I'm happy because it includes some work I did on Atari800 to support
very small screens :) (I was working to get it to run on the Agenda VR3,
which is another Linux-based PDA)

Some photos of the emulator (running in both portrait and landscape)
are on his site.

Enjoy!

That is VERY cool !

I'm considering buying an iPAQ and that's just one more reason. Any plans
from anyone to get a Pocket PC OS version ? (My job means I probably won't
be able to run Linux on it !)

Umm... you're using the wrong end of the telescope.

A decade ago there were several choices of competing Operating
Systems.

Now for all intents and purposes there is only one.

(MacOS is a far distant second.)

With the kind of momentum behind the current OS, it's unlikely that
any other OS will be able to overtake the existing software base for a
long, long time, if ever.

Go to the local CompUSA and check out how much shelf space is devoted
to native Linux apps.

I rest my case.

>

The simple answer is that there was nothing else available and very
little was available for what WAS available.

There was nothing that would run a competent word processor or
spreadsheet, or play a photorealistic game, or render in 16 million
colors, or typeset a page layout, or sort and relate a million entry
database.

If you wanted something other than what you could buy from the back of
Compute's Gazette, you had to learn to program and write it yourself.

There weren't stores like CompUSA where you could just buy the program
and get on with whatever it was you wanted to do.

You HAD to figure out how to POKE graphics to the screen, or VARPRT to
find out where your string variables were stored.

When I bought my first computer (an even older fart), an OSI C1P, I
wanted to play games on it. I bought game programs and ended up
HAVING to learn to program to fix the bugs in the "commercial"
programs. I had to learn the "guts" of the computer to figure out
how to add sound to the games since the manufacturer had designed
sound into the system but not implemented it.

Sure it was fun, and sure I learned a lot, and actually made some
money with it, and yes indeed, I wouldn't have missed it for anything.

But it wasn't what I'd originally wanted to DO with "a computer".

Now, you don't need a soldering iron or disassembler to do what you
want a computer to DO. In most cases, you just get the software and
DO it.

Not everyone wanted to "tinker" with a computer. Computers didn't really "take off" until they became capable enough that you DIDN'T have to tinker with them to get them to do something.

That doesn't help the "tinkerers" very much, I know, but that's the main reason things are different today than they were when 8-bit computers were the only thing available.

That's actually what the original intent of this huge message thread was, to provide a "new" version of the machines we used to tinker with.

Errk, I don't know about that. I read more about ATOS at your site and
see that it is only for XL/XE. It wouldn't work for my 800. I am not
asking you to support 400/800 or memory less than 64K. That would be
cruel and unusual punishment for a GUI author!

Sure! I bet your server is about 10 times faster than mine. ;-)

>but are joystick and
>keyboard also supported (the standard pointer devices for A8)?

The keyboard isn't supported. But you can use ATOS with other pointer devices through the use of the appropriate Multi-Mouse driver.

>What memory is needed or supported? Is it using a swap-file like
>Windows?
>

Right now ATOS doesn't use any of the extended ram banks. Users can set their ATOS system up to use a ramdisk quite effectivly though. Maybe in the future I might place some things in the extended ram banks but I'm not sure how many users actually have more than 64k. I may have to take a survey.

ATOS uses swap files called overlays. There are two types of swap files. The first type is a partial overlay that only saves the screen memory and the area that modules run in. This is used for running modules designed to run as an ATOS accessories. The second type is the big overlay that saves everything the partial overlay does, plus the core area, zero page, the processor pointer, and a couple of other things. This is saved whenever ATOS runs a regular COM file and is reloaded when it's done to restore the machine state.

Best,
Tom

If your 800 has RAM up to $BFFF and a hard drive like the Corvus then
I think it could run ATOS if I could find how to intercept the command
processor in BW-DOS. I'll check into it when time permits.

4636. Antic's and Analogs for Sale

Over the next six months, I'm going to reduce my Atari "position". Some items will be sold; some auctioned (as much as I hate to mess with that). First on the block are some odd lots of early Antics and middle Analogs. These are going to go for mainly $2 and a few at $3 each, depending on age and condition, plus shipping. I checked with the post office, and I can ship these as media mail which is pretty economical. If you are interested, send me an email for a list.
Thanks,
Larry

Kind of... motorola rate their Coldfire 90mhz to consume .95watt. That seem alot compared to
mobile pentium3 running at 10x the mhz. I dont think their is any >200mhz Coldfire...

They often review with loaner software prior to release. Analog
magazine carried news of the CBS/K-byte deal:

http://www.cyberroach.com/analog/an08/default.htm

They note the delay of two months, presumably while CBS repackaged and
promoted the product.

I looked into this at one time, but if I remember correctly, the serial port capabilities of the portfolio are pretty abysmal (I think 9600 baud at best). I don't think its capable of talking on the SIO bus at 19,200 baud.

On the other hand, I think a Palm OS machine could do it easily, and I've almost started this project a few times myself.

Andrew,

> Anyone know what this cartridge does?

Not much. Was advertised in Analog (#14). Apparently you can load
a program to the cartridge from disk or cassette. The purpose, I
gather, was to test how your code would work as a cartridge. There are
a lot of such utility carts advertised in the old mag like static
rams, memory expansions etc.

Still have a few questions about other titles:

Atari Inc ?79 BASIC Computing Language
At most, this would seem to be a label variation. There are only 3
Basic revs and they are elsewhere in the list.

Reston Movie Maker
Advertised in 1984 (during the crash) as "coming soon". Perhaps
some beta exists. Has anyone sent in a cart scan ?

Concepts for Darren 86 Math Works: Addition
Concepts for Darren 86 Math Works: Basic Subtraction
From where? US? UK? Any info appreciated.

Softmark 86 ESP Mindlock
Seems to be a "holy grail" among some people. Any evidence of
existence?

regards,
Gene

A GUI for the ATARI 800 is a very difficult thing: first, you have not so much memory, the second is, that Turbo-BASIC doesn't run on it...so we (the authors of the two GUI's) had to write a very new version of a GUI. No question, it's possible, but difficult...

I could try to write a GUI in Turbo-BASIC 1.4 (for ATARI 800), but I really had to begin with a very new program and concept...

4647. The old GUI for the ATARI-8-Bit

Newsgroup: comp.sys.atari.8bit
Date: 2001-07-25 18:11:07 UTC
From: Mirko Sobe <atarixle@12move.de>
Message-ID: <9jn20o$18c7$1@wrath.news.nacamar.de>
Source record: 35171

I have to tell you, that I will stop my ATARI activities. But before I do this, I will update BOSS-X (available at www.atarixle.de) to the best version ever. So, download it and enjoy...

Mirko

4649. Atari tunes on real instruments

Newsgroup: comp.sys.atari.8bit
Date: 2001-07-25 19:27:17 UTC
From: Frank Schroeder-Hoeftmann <frank_sh@web.de>
Message-ID: <9jn6a2$3lv$1@renate.komtel.net>
Source record: 35172

Hi there!

Today I�ve received the wonderful "Back in Time 3" CD. (For those who are unaware of this CD: it contains famous C64 games� tunes newly arranged and recorded with "proper" instruments).

I am wondering if anybody has ever done the same thing with Atari 8-bit tunes. (There is, however, a very cool "Elektraglide" remake out there, but that�s also based on the C64 version.) The ASMA collection is comparable to the HVSC, which is a nice thing.

But anything rerecorded? "Jet Set Willy" would kick arse! (-:

Frank

Source record: 35174

> bung haja@bung.com remarked:

>I just opened my XE. When I click on that plastic thing which contains
>the connections with my fingers all the keys work except the RESET.
>Can I clean it with acetone?

NO! NO! acetone will dissolve or soften most of the plastic components like the XE case and the keys, etc... If a solvent is required, try TV tuner cleaner and test it on the bottom of the case first. Also some degreasers like trichloroethylene or trichloroethane.

>How can I remove the plastic from the XE? It is connected to the
>mainboard, I think it is glued to another one right at th connection.

I have never seen one glued; the keyboard mylar usually plugs into the friction connector on the main board sort of like a thin edge card type. The traces on the mylar often wear a little thin after a half dozen unplug/replug cycles so care is a must.

-Ron

Experience is something you don't get until just after you need it.

No remakes, but Andreas Magenheimer from Germany compiled many audio-CD's
filled with original tracks taken from games and demo's. He sells (sold?)
them for a very low price. He's in csa8bit so he'll probably hook into
this thread himself :-)

Tom Hunt <NoOne@FakeEmail.com> wrote

: >but are joystick and
: >keyboard also supported (the standard pointer devices for A8)?

: The keyboard isn't supported.

That's a pity. Keyboard may be useful if one has no mouse or joystick
available (which always happens to me when visiting a meeting :-))

: But you can use ATOS with other pointer
: devices through the use of the appropriate Multi-Mouse driver.

Is there info about how to program such a driver (asm equates,
entry-vectors, or whatever)?
Then one could write a keyboard-driver. Or a lightgun-driver! Looks cool
to me, shooting at windows :-)

: ATOS uses swap files called overlays. There are two types of swap files.

: The first type is a partial overlay that only saves the screen memory and

: the area that modules run in.

Sound very "BBS Pro!" to me :-))

Sounds good. Just be sure to change the startup.bat file so that SHELLGX
gets loaded and do a BOOT X32GX.DOS when running it on a real 8-bit using a
real hard drive.

Best,
Tom

: be able to run Linux on it !)

Hmm... Dunno. You'll have to ask the author. It'll probably be tougher
to port to Pocket PC (WinCE, right?) than it was to Linux on the iPAQ.

To port it to Linux probably only needed a few hacks to get it to run
smaller and faster. Porting it to WinCE would mean calling completely
different APIs. :(

I know there's a 2600 emu. in the works for iPAQ (running WinCE)

Lol ;) We had this same war almost exactly 1 year ago! It's similar to
Goddards Law! (Godwin?) First, someone will point out the origins of
specific technological advances, then we'll rebut with 'but he was
/born/ in country /y/ so /x/ doesn't get the credit!'

Then someone will say Americans are all fat and eat at McDonalds, then
someone will rebut with Europeans have teeth that look like dice.

You know it's going to happen, the bloods in the water, the sharks will
come. :)

Sigh... the software base for the existing Operating System is the
point.

The point is that the Operating System a decade from now will likely
be the same, or a derivation of the current Operating System, so the
software base a decade from now will likely be the same software base
as it is now, with incremental changes, not radical shifts in support
for "other" Operating Systems.

Source record: 35192

Basic XL had the "Toolkit". On the Toolkit disk there are extensions and a runtime package as well as sample programs with and without the extensions. The extensions work only with BXL 1.02 and 1.03. The extensions were 33 sectors long (roughly 4K). It mainly provided capabilities for using Procedures (instead of subroutines).

In addition, there was at least one other commercial runtime package that was shorter (78 vs. 109 sectors). It may have been a custom version, since I have only seen it on one commercial product. Since there never was a Basic XE runtime, the BXL runtime package provided at least part of the neat additions in a runtime environment.

4671. Atari 800 computer system w/ tons of extras!!

Newsgroup: comp.sys.atari.8bit
Date: 2001-07-26 05:31:09 UTC
From: Joe Grand <jgrand@mindspring.com>
Message-ID: <3B5FAB1D.CFD41BB9@mindspring.com>
Source record: 35195

As the subject says!

Atari 800 computer system w/ tons of extras!!
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1258995238

System and Accessories:

o Atari 800 Computer w/ 48K RAM and power supply
o Atari 1030 direct connect modem
o Atari 1050 5.25" floppy disk drive
o Additional power supplies and cables
o Kraft joystick
o TV switch box

Games and Cartridges:

o Centipede
o Star Raiders
o Pac-Man
o Missile Command
o Pengo
o Music Composer
o BASIC
o Chessmaster 2000 (floppy disk)

Books and Manuals:

o Atari Technical Manual and Reference Guide!
o Your Atari Computer: A Guide To Atari 400/800 Personal Computers
o Atari BASIC
o Atari Sound and Graphics: A Self-Teaching Guide
o Machine Language for Beginners
o Atari Graphics
o Compute!'s Guide to the Atari: Part 1
o Compute!'s Guide to the Atari: Part 2
o Compute!'s Guide to the Atari: Part 3
o 6502 Assembly Language Programming
o Other manuals and documentation for Atari games and components

Joe

<snicker> "CompUK" has a funny ring to it :)

Well see what the justice department says about the future of the
platform :)

Hopefully they'll take they're head outa theyre arse and leave them alone, I want to see how Darwinism treats Microsoft.

SNL had one of their best commercial spoof featuring Mike Meyer doing an
add for a British touthpast made from real sugar...
At one point he said: "You dont need to brush your teeth every week, but you might just
want to"

Or something in those lines.

Off topic? oh well...

4674. Classic Gaming Expo 2001 Update

Newsgroup: comp.sys.atari.8bit
Date: 2001-07-26 08:37:57 UTC
From: jhardie@pipeline.com
Message-ID: <3b60d6d1.99695655@news.pipeline.com>
Source record: 35048

```
Classic Gaming Expo 2001 Update 6-26-01
---------------------------------------

Well, the show is just about 2 weeks away now and we've
got a ton of information to pass along to you. Don't
forget that advance registration ends on Friday (6/27),
so get your tickets now.

**********************************

Dragon's Lair 3-D Update!!!

We've just been able to confirm that legendary animators
and Dragon's Lair co-creators, Don Bluth & Gary Goldman,
will be appearing at CGE 2001. They will be joining
Rick Dyer and John Pomeroy, both of whom had already
committed, for a video presentation and keynote speech.

This is the first time the four creators of Dragon's
Lair have been together in the same room since 1983!

**********************************

Incredible Arcade Collection!

Speaking of Dragon's Lair, it will be one of the many
laser-disc arcade games on display at this year's show.
Steven Hertz will be bringing his awesome collection of
arcade games to CGE for play by all attendees. Below
is a list of titles Steven has confirmed with us:

Dragon's Lair
Thayers Quest
Cliff Hanger
Begas Battle
Cobra Command (dedicated)
US Vs. THEM
Badlands (dedicated)
Badlands (UA Cab)
Super Don Quix-ote (dedicated)
Star Rider
Fire Fox
Galaxy Ranger
NFL Football
Interstellar
Time Traveler
Star Wars
```

Tempest

Add to that list the approximately 20 arcade machines being supplied by Blast From The Past Amusements, and many more from Tim Arnold of the Las Vegas Pinball Collector's Club, and you can see that they'll be plenty of free play all weekend!

****

Infogrames To Show New Titles!

We've just received confirmation that Infogrames plans to debut two new titles at Classic Gaming Expo. On display for the first time anywhere will be:

DIG DUG Deeper
and
MS. PAC-MAN Search for the Golden Maze

Stop by their booth and be one of the first people in the world to try these new titles!

****

New Game Releases!

In addition to the previously announced titles by CGE Services and Retrodesign, there are several new games that have been announced. Here's the current line-up:

Atari2600.com - Secret Agent (2600)
Digital Press - Ms. Space Fury (Coleco)
Ebivision - Allia's Quest (2600)
Joe Grand - Scsi-cide (2600)
Brian Prescott - Base Defender (2600)
Crazy Valet (Special) (2600)
Retrodesign - Combat 2 (2600)
CGE Services - Dig Dug (Coleco)
Joust (Coleco)
Pac-Man (Coleco)
Elevator Action (2600)

****

New Alumni Guests Signed On!

We've added some great new guests to the celebrity list at the show web-site. Here's a small sample of some of the people who will be joining us:

Ralph Baer - Father of Videogames
Don Bluth - Dragon's Lair creator
Garth Clowes - Founder of Entex - Adventurevision
Rick Dyer - Dragon's Lair & Halcyon creator

Franz Lanzinger - Crystal Castles (Arcade)
Alan Miller - Co-founder of Activision
...and many, many more.

Check out the latest list at:
http://www.cgexpo.com/guests.html

****

Larger Museum Exhibit!

We've added a ton of stuff to the museum this year and one of the highlights will be an incredible collection of handhelds from the personal collection of Rik Morgan, who runs www.handheldmuseum.com

Rik will be on-hand and displaying some of his best stuff. You'll be in awe when you see this collection. A lot of stuff we never even knew existed!

****

Songbird Prod. Announces Lynx/Jaguar Display!

Carl Forhan of Songbird Productions has announced that the Songbird booth will feature a display of rare and prototype Atari Lynx and Jaguar items. See some of the unreleased games that never made it out the door as well as hardware, development systems, and other goodies.

****

Time For Another Auction!

You asked for it! You got it! Many people have asked us about running another auction at CGE. While we have been hesitant to do so in the past, due to bad past experiences, we have decided to have another go at it. The auction will take place on Sat. night, right after the swap meet at 6pm. Check out the auction information page at: http://www.cgexpo.com/auction.html

****

Twin Galaxies to Host World Championships!

Like last year, we are once again working with Walter Day and the Twin Galaxies crew to host contests on various home systems and arcade machines. Of special interest will be the Atari 2600 contest which will take place throughout the weekend. Cash prizes are planned for all winners!

****

TV Commercial Archive Volume II

The VHS compilation of classic videogame TV commercials
that debuted at CGE '99 has been re-mastered and updated
and will debut this year at CGE 2001!

Volume II consists of cleaned-up versions of all the
commercials included in volume I PLUS about 35 new
commercials including, believe it or not, a VECTREX
commercial! The tape weighs-in at a full 60 minutes
of video as opposed to 36 minutes on volume I.

****

Save Big $$$ with CGE Discounts!

Don't forget that we've arranged for special discounts
on airline, hotel, and car rental prices for all our
attendees. Airline Discounts are available on South-
West and Continental Airlines, the Plaza Hotel has
great rates on rooms, and you just can't beat the
unbelievable prices offered by Payless Car Rental.

For more information on our special show discounts,
stop by: http://www.cgecpo.com/discounts.html

****

That's all for now. Remember, you can always check
the show web-site at: http://www.cgexpo.com for all
of the latest updates and information.

Be sure to stop by and say "Hi" when you get to
Vegas. We look forward to meeting you!

Regards,
John, Sean, & Joe

4675. VINTAGE COMPUTER FESTIVAL EAST 1.0!!!

Newsgroup: comp.sys.atari.8bit
Date: 2001-07-26 11:20:41 UTC
From: vcf@vintage.org
Message-ID: <d2T77.645$Kd7.776429@news1.rdc1.sfba.home.com>
Source record: 35049

Vintage Computer Festival East 1.0
July 28th and 29th, 2001
Royal Plaza Hotel and Trade Center
Marlborough, Massachusetts
http://www.vintage.org/2001/east/

The first Vintage Computer Festival for the east coast of the United States is scheduled for the weekend of July 28th and 29th at the Best Western Royal Plaza Hotel and Trade Center in Marlborough, Massachusetts.

The Vintage Computer Festival is a celebration of computers and their history. The event features speakers, a vintage computer exhibition, and a vintage computer marketplace. We showcase all different types of computers for all differents kinds of platforms in all different shapes and sizes.

If you wish to pass the word about the VCF along to your co-workers, a printable flyer in Word format can be downloaded here:

http://www.vintage.org/2001/east/vcfeast.doc

SPEAKERS AND WORKSHOPS

We've got a terrific line-up of speakers at the inaugural VCF East. The speakers include:

Wayne Green

Founder of Byte and 73 Magazine, among many other publications. The influence of Wayne's computer publications propelled the microcomputer revolution of the 70s and 80s.

Eldon Hall

The "Father" of the Apollo Guidance Computer, Eldon will discuss the development the computer that brought the first men to the moon.

Christine Finn

Christine is bringing the discipline of an archaeologist to the study of computer history. She'll be discussing her upcoming book "Artefacts: The Material Culture of the Silicon Valley".

Michael Nadeau

Michael will be taking on the subject of determining the value of old computers for buying, selling and trading. He's also writing a book on the topic.

Megan Gentry

Megan, a former DEC employee, will be giving a workshop that
every beginning collector of DEC gear will want to attend.
She'll also be exhibiting the PDP 11/73 that was used to control
the heating and air systems at The Mill (DEC's former headquarters).

Curt Vendel

Curt founded the Atari Historical Society to spread the gospel
of Atari's relatively short but significantly colorful history.
He'll be giving a talk about Atari's history and the collection
of Atari items he has in the AHS archives.

The speaker schedule can be found here:

http://www.vintage.org/2001/east/speaker.php3

FABULOUS DOOR PRIZES!

Year after year, the VCF always has the best stuff to give away, and
this year is no different

o Complete NeXT "Cube" to be awarded to one lucky attendee!
o Mindset computer to be given away to the Best of Show Exhibit!

These prizes are being furnished by the Atari Historical Society.
Visit the AHS at:

http://www.atari-history.org

VINTAGE COMPUTER EXHIBITION

Come see a room full of functioning computers going back three decades!
The VCF Exhibition is always an exciting place to learn about computer
history in a first-hand, hands-on manner.

Vote on your favorite exhibit and help the Best of Show exhibitor go
home with a Mindset computer. The Mindset was hailed as a major
innovation when it debuted in 1983, with multimedia sound, graphics
and video editing features.

This machine is being provided by the Atari Historical Society:

http://www.atari-history.org

BUY/SELL/TRADE AT THE VINTAGE COMPUTER MARKETPLACE

Looking for an old computer to add to your collection? Have some
spare items you'd like to sell? Want to meet other collectors to
trade with? The VCF Marketplace is the best place on the planet to
do all these things.

You can still bring items to sell in the consignment section. For
information please visit:

http://www.vintage.org/2001/east/vendor.php3#consignment

TELL A FRIEND! TELL A FRIEND! TELL A FRIEND!

We really hope to see you at the first VCF for the east coast! And remember, tell your friends!!

A printable flyer in Word format can be downloaded here:

http://www.vintage.org/2001/east/vcfeast.doc

Vintage Computer Festival East 1.0
July 28th and 29th, 2001

Well, gosh, I'm _so_ sorry I got that wrong. Can't imagine why I wouldn't have _known_ that.

Actually, it seems my biggest problem is finding a Philadelphia-area user who could do this _for_ me, in exchange for goods and services.

I've looked into the various methods for transfers, and it doesn't look like any of them are terribly easy. Several seem to require really ancient PC hardware, like 5 1/4" disk drives that work with a particular program, and even then with only one kind of density disks (and I tried this on my old 386-- it didn't work). Others require cables that are either discontinued or too custom-designed for me to build. There was a system that ran an Atari drive through a PC's ports, which would have been _great_, but it apparently doesn't work all the time. Others require a terminal program for the Atari that I don't have-- and no, I can't download it from the Web, since the only modem I have for my Atari runs somewhere between 300 and 1200 baud.

Now, I figured, there's got to be someone who's _done_ this work before, who might even have his Atari set up with his PC, and might be able to do the transfers without too much trouble. I can arrange some kind of trade, hand him the disks, and walk away with a handful of 3.5" IBM-formatted floppies. Or something. So, is there anyone who's capable of doing this?

I try to come to Lengenfeld. But I will not be there with my ATARI. I will
need someone, that lends me his ATARI for presenting BOSS-X.
And I will stop my ATARI activities only for a short time, may be 1/2 year
or less or more, because, I spend too much time sitting at the computer.

I will debug BOSS-X and make an english version, than I try to translate the
BOSS-X-manual.
Then, BOSS-X is over. If I then write a new version (after the break), it
get's another name, because "BOSS" sounds not good.

Mirko Sobe <atarixle@12move.de> wrote

: I try to come to Lengenfeld.

Thats a good thing.

: need someone, that lends me his ATARI for presenting BOSS-X.

We're in doubt about how we will travel. My van is for sale, and the current owner of the old Cadillac Hearse I want to buy is on a vacation and I'm not sure if I have that car in time. When I haven't, we have to travel in a small car, so no space to take some aditional stuff with us. With the Cadiallac I have some more space, so I could bring an extra set-up (XE + XF551 + 1050 + monitor).

: And I will stop my ATARI activities only for a short time, may be 1/2 year
: or less or more, because, I spend too much time sitting at the computer.

Make at least sure you'll be back :-)

: If I then write a new version (after the break), it
: get's another name, because "BOSS" sounds not good.

Actually, "BOSS" sounds quite good to me. Unfortunately, as a dedicated Sparta-Dos user I can't make advantage of it myself. I know it works with BeWe-Dos, but I run into trouble with the 4 drives limit...

4682. Re: the RESET Key in my 130XE does not work. Is it difficult to fix it?

Newsgroup: comp.sys.atari.8bit
Date: 2001-07-26 21:49:41 UTC
From: rhamiiton5@aol.comedy.com
Message-ID: <20010726174941.25926.00001572@ng-cf1.aol.com>
Source record: 35056

Not necessarily... although it appears to be a possibility.

What exactly do you mean by "click on that plastic thing"? Do some keys not function unless you are 'clicking'?

Have you verified that the Reset key itself is connecting the traces? Can you follow the traces and connect the correct two for testing Reset?

If we know the trace makes contact under the Reset key, then unplug the mylar from the main board and examine the end for a discontinuity. A paint on liquid is available at electronics suppliers for repair or you could explore the possibility of carefully trimming about 1/8 inch from the mylar and reseating to the main board.

>bung haja@bung.com asked:

>Do you think I need a new mylar?
>>>I just opened my XE. When I click on that plastic thing which contains
>>>the connections with my fingers all the keys work except the RESET.

-Ron

Experience is something you don't get until just after you need it.

Not in Plilly... How many disks are involved? Can you do it thru the mail?

What Atari 8 equipment do you have in working order? Someone could mail to you
a disk with BobTerm if you can make a null modem cable.

>Brian Siano bsiano@bellatlantic.net remarked:

>Actually, it seems my biggest problem is finding a Philadelphia-area user who
>could do this _for_ me, in exchange for goods and services.
>
>I've looked into the various methods for transfers, and it doesn't look like
>any of them are terribly easy. Several seem to require really ancient
>PC hardware, like 5 1/4" disk drives that work with a particular program,
>and even then with only one kind of density disks (and I tried this
>on my old 386-- it didn't work). Others
>require cables that are either discontinued or too custom-designed
>for me to build.
>There was a system that ran an Atari drive through a PC's ports,
>which would have been _great_, but it apparently doesn't work
>all the time. Others require a terminal program for the Atari that
>I don't have-- and no, I can't download it from the Web, since
>the only modem I have for my Atari runs somewhere between 300
>and 1200 baud.
Now, I figured, there's got to be someone who's _done_ this work before,
>who might even have his Atari set up with his PC, and might be able

Well,
you can of course also use a good Atari sector copier for that job. One
that writes empty sectors, for every error sector appearing. (Good
programs are: Mycopier 2.x, Disk copier and many more) - Andreas

Well,
why not try ABBUC Bauplanservice ?? They have dozens of schematics for
any RAM upgrade you might think of. Visit www.abbuc.de and click to
"Bauplanservice" on the left. You should get some german text, the
e-mail of the service-master and a list of avaiable schematics. Think,
they are not online yet, but surely ABBUC will mail them to you...

4690. Re: 3-D Atari?

Newsgroup: comp.sys.atari.8bit
Date: 2001-07-27 15:07:34 UTC
From: Andreas Magenheimer <magea000@mail.uni-mainz.de>
Message-ID: <3B6183B6.9B5E029F@mail.uni-mainz.de>
Source record: 35064

Well,
actually I do not have Sega 3D glasses. But some time ago, german AMC Verlag developed the first (or at least the first german) real 3d Atari 8-Bit game, using red+green glasses. it was a 3D skiing game called "Superski". it used a combination of joystick+paddle for gameplay (paddle to control left+right movement, jostick to speed up, slow down and jump). The paddle was also there to do the 3D setup (you could see the 3d ski`s coming out of the screen or going into the screen, next you could change the flicker or frame rate and such things; finally you could also switch off to "flat" 3D mode as seen in other games, like Mercenary, F15, Thomahawk, Fighter Pilot and such). Unfortunately the chief of AMC Verlag (Armin Stuermer) died in 1998 and since a) the game is copy protected and uses Compiled Turbo Basic *** plus b) a special paddle+joystick controller (called Multipad or Powerpad), it does not make any sense at the moment to make copies of this game.

I got the rights to all AMC games (sorry folks, mostly german!) but since I have no knowledge of removing any copy-protection or copying such games, I gave permission to ABBUC to do so. For Superski, maybe someone can a) unprotect it and b) change the code in such a way, it will work with a standard paddle controller. You normally have to start the game with the joystick fire button, which is not avaiable for a paddle => change it to paddle fire button. Next, the controls (left+right) are already set for paddle, no changes needed here. But, to be able to jump, it would be nice to use the paddle trigger again... (Well, speeding up or slowing down is not so nescessary in my eyes!) If someone would be able to do the changes, I would send him a copy (original 5,25" copy protected Atari XL disk with red/green glasses) free of charge, but I would like to have a complete patch, not just the protection removed!!!
-Andreas

*** for the PC there is a disassembler program from Jindrich for different compiled Basic programs avaiable, called CHKBAS.EXE. it also disassembles compiled turbo-basic...

4696. Re: Atari tunes on real instruments

Newsgroup: comp.sys.atari.8bit
Date: 2001-07-27 15:50:58 UTC
From: Andreas Magenheimer <magea000@mail.uni-mainz.de>
Message-ID: <3B618DE2.2F895821@mail.uni-mainz.de>
Source record: 35070

Well,
I am still selling these audio-cd`s for 5 german marks (5DM) per cd.
they contain real atari tracks, meaning I connected my little atari to
the hifi system and recorded the complete sounds with a DAT recorder
(using a higher recording volume of course). Next I copied these sounds
to the Mini-Disc and snipped off all loading noise (I used the
mini-disc, since it has some cool editing features, the CD, DAT and Tape
recorders did not have). finally I digitally copied the mini-disc to CD.
However, I did not use any equalizers, enhanced stereo or surround
emulations, dolby noise reductions (except for the MOD sounds, but they
are still very noisy) and such, but recorded the sounds as they were. of
course I could have done better, but I did not want to change the sounds
or create "fake" atari 8-bit sounds...

The audio-collection includes 10 CDR`s (TDK) filled with atari demo
sounds and 10 CDR`s (TDK) filled with atari game sounds. Regarding the
game sounds, there are quite many old sounds from the early 80s on these
CDs, but not quite so many polish sounds from the 90s (since the polish
sounds/games are not so pretty well known in western europe or america).
Every audio CD has a running length of 60 minutes or more. all 20 audio
CD`s contain 600 atari sounds... Until today I have sold 4 collections
(two complete collections with 20 CD`s amongst them), not quite much.
But it looks like -at least the german- atarians prefer the newer polish
sounds... Ok, enough said. Mail me, if you are interested or
want to see a list. If you are not living in germany however, you might
have to pay more for porto and package, than for a single audio-cd (thus
buy more than one CD!). -Andreas.

The XL is stiff, but it does slide out of the connector. Is the end of the XE mylar not inserted into a spring loaded slot with contacts?

Yes, the Reset and console keys (not certain about Help) should have their own dedicated trace which is connected to ground thru the action of the key on the mylar trace. If you can locate and isolate it, you can substitute your own switch to make the same circuit.

>bung haja@bung.com replied:

There is a folder that contains individual arcs. Click on the download ATOS
link and then select files2. 19 files total.

> Last I heard, they were threatening to not let MS release XP...

That would just suck. (not that I'm a huge fan of Microsoft)

How will we ever find out if we can make an OS that's better than
Windows if the government steps in?

I think this should be handled differently. Did Microsoft illegally
kill DR-Dos? the court thinks so? ok, then award damages, move on.

Did they kill Netscape, the court thinks so? award damages.

are they crippling Kerberos? the court thinks so? make them open the
documentation to the proprietary extensions, move on.

Can the US government keep M$ from selling XP overseas? now that would
be interesting if M$ just said, "OK", and then kept selling 2k to the US
and XP to the rest of the world.

The only thing worse than Microsoft dictating what software we have
available to use, is the government doing it.

This hurts the Linux crowd too, if you think about it. We're working our
asses off to get the government to understand that source code is a form
of speech protected by the first ammendment, hoping to overturn the
DMCA, and this just works against it.

There are alternatives to Microsoft, Microsoft is not a monopoly,
everyone just uses windows, there's a slight difference. We could use
linux couldn't we? What about the Mac?

It's not Microsoft's fault everyone isn't using something else instead,
so far Windows has no competition only because noone is competing. There
are alternatives, and they're developing. let the market work it out for
itself. Maybe Linux will catch up and bury Microsoft. I'd rather see
this happen than see XP banned, or Microsoft split up.

What would the government do to Linux if Linux had "embraced and extended" or anything else Microsoft has done? I wonder. Could they do anything, even?

I checked the XL (believing the XE is similar) again; the mylar has 18 traces for the standard key matrix and five more traces for the console keys separated from the 18 by a gap toward the front of the case.

You will not be able to solder to the trace because the mylar would melt... With care, you might tack a wire to the mylar ribbon connector on the top or perhaps the bottom of the main board for patching into the circuit.

In any event, the task at hand is to find a creative way to access that Reset key trace and join it to a switch installed thru the case for closing to ground.

ATOS comes set up with all kinds of interesting programs and
applications. You can cut out most of the extra stuff if you just want
to see it boot up. If you don't install the BASIC programs, games, HIPs,
CMC musics, etc., and most of the wallpapers and icons, you probably could
make it fit onto your system. But I'm not sure how practical such a setup
would be. It might be done to satisfy one's curiosity. If you have a
ramdisk you could configure ATOS to use it for overlays, icons, object
files, etc. One of these days I want create an ATOS setup that might be
based upon two 180k floppy drives and a 256/320k ramdisk. With such a
setup I'll make it so that if you click an icon in a window and it cannot
find the desired program it will prompt you to "Please place the correct
floppy disk in the drive and click OK", or something like that. But this
is on the list of things to do, right after completing the online manual,
bug fixes, new feature requests, etc. ;-)

Best,
Tom

You might be able to use the conductive liquid that is sold in auto
parts stores that repairs "stick-on" type window defrosters.

Mask the mylar with masking tape and brush the liquid on to repair the
break.

Just a thought.

Message-ID: <aHq87.906$6V.245144@dfiatx1-snr1.gtei.net>
Source record: 35100

Are the 41464 chips found in the XEGS the same as 4464 chips used for 600xl memory upgrades?

Douglas

Source record: 35099

Hi, it's me Ben. Regarding your Handle, "Wolf 359", what's that about. Are you into astronomy? I am a complete Novice, but I do have an interest. I use (occasionaly) the Atari ST software Atari Planetarium. I also love to play Frontier Elite II on my ST, going to the Star System "Wolf 359". Or maybe you use Wolf 359 because your a Star Trek Fan and the Enterprise engaged the Borg at Wolf 359 where Picard was assimalated? Regarding using the word "Honest" with my name as a Businessman. Business has been slow with the economy as it is and I needed to find a way to pay Bills, with no money coming in. And because I have a potential customer who doesn't trust and who posted a message in the public NewsGroups asking about me asking if He should have His head examined to do Business with me. I thought I'd post messages about it, to clear up confusion. Plus did I mention I really need the Business, my Atari income, which is the only work I can do has really slowed to a crawl due to a Depression of an economy?

==Thanx==
===Ben===

> anything, even?

Linux COUDN'T embrace and extend... Embrace and extend involves not only adopting and corrupting an accepted standard... It means keeping the additions and changes to that standard secret. (Or refusing to allow it's use elsewhere). Kerberos is the perfect example.

They took the code from the FreeBSD codebase. As FreeBSD license allows anyone to do anything with the source code they want as long as there's an acknowledgement, they extended it and then, when someone found out what the extensions were and posted source code, M$ forced them to remove it from the web.

4732. Re: Atari tunes on real instruments

Newsgroup: comp.sys.atari.8bit
Date: 2001-07-28 12:24:12 UTC
From: neilt1966@yahoo.co.uk
Message-ID: <2be9516c.0107280424.280ac1e1@posting.google.com>
Source record: 35106

On a similar topic, it's been bugging me for ages that the guitar riff
in Daft Punk's Aerodynamic is the music from the Atari 8-bit game
"Whistler's Brother".
http://xlent.nostalgia.pl/software/games/w/0015.html

I had assumed that this riff was a classical or rock one that had been
ripped off both by the game and Daft Punk, but I can't find any
reference to it, so now I'm thinking maybe Daft Punk ripped it from
the game -- it's been done before!

A clip of the song (with part of the riff) is on Amazon:
http://www.amazon.co.uk/exec/obidos/ASIN/B00005A9ZC/o/qid=996322531/sr=2-1/ref=sr_sp_bow_1
_1/202-8118908-9063868

Can anyone confirm or deny, or tell me where the riff came from?

Cheers,

Neil.

Windows 3 could run software written for Windows 2 and probably even
Windows 1, not to mention all the DOS apps available at the time.

Yes, but it wasn't the best software base available, which was *my*
point.

Actually it's because they don't own Amiga any more. If they had released an Amiga under the Gateway name, then what you ay is probably true. However, if they had released one under the Amiga name it wouldn't have mattered. Anyway, this is all ancient history now.

Perhaps I'm out of date, but I seem to recall Gateway creating a a subsidiary
wholly owned, that was to create and sell Amiga/DOS hard/software.

Yes, but you're out of date. Check out http://www.amiga.com

5$ for the printer and 30$ for the cardrige? :)
You can get decent usb inkjet printers for <80$.
If someone cant spent 40$ on a printer, and can only afford 5$, then they really
need to get creative to refill those cardriges.

They did, and you *are* out of date.

Gateway created Amiga International IIRC, which was wholly owned.
However, they screwed around with various half hearted plans, and
various chief execs, and finally sold everything except the technology
patents to a company called Aminos at the end of 1999. Aminos was
owned by a consortium of people, the two most prominent ones being
Bill McEwen and Fleecy Moss, both enthusiastic Amigans and former
Gateway employees. Aminos has since changed its name to Amiga Inc
(http://www.amiga.com) and they hold all licensing rights to Amiga
technology.

There's quite a lot going on in the Amiga scene at this time.

I may be missing something here so ill warn you first.. There is a product out for just this type of repair. It is conductive silver based grease/ink that comes in a pen and can be found in finer electronics stores. It is used in the Surface mount industry and I got mine at Fry's electronics out of California. Hard to find but it isn't that expensive. It worked great on my 130 xe repair of a broken trace.

4753. PAL color tuning

Newsgroup: comp.sys.atari.8bit
Date: 2001-07-28 22:03:15 UTC
From: Itay Chamiel <itaycspam@cs.huji.ac.il>
Message-ID: <9jv96l$41b$1@news.huji.ac.il>
Source record: 35124

Hi all,

I just tried installing a PAL 800XL that I have laying around. I'm not used to PAL machines, I usually use NTSC machines and my regular computer is an NTSC 130XE.

What I noticed when I fired up the PAL unit is that:

1. The screen is much less taller than the NTSC screen: A regular graphics 0 text screen looks more like a letterboxed movie than a full screen of text.
2. The background color is green instead of blue.

Now, I suppose problem 1 is normal - a given amount of scanlines will appear smaller on PAL monitors because they have more scanlines.. Why didn't Atari make use of all that extra space for a larger text screen?

Problem 2 is annoying. I'm pretty sure my colors are off and I have no idea how to tune them.. There is no hole through which I can tune a color pot, and nothing to tune on the monitor, so what do I do?

-itay

Ok, not a good example, I'll pick another one, what if Linux integrated a free web browser into it's interface? What if (hypothetically) this put someone out on the street. What could the government do? Should they do anything?

> Kerberos is the perfect example.

This is where that double edged sword could hurt Linux. If the government is empowered to bitchslap developers who change protocols to extend them, could not this empowerment also be used to bitchslap developers who reverse engineer protocols to be compatible?
I think the safest ground we could stand on would be that protocols be considered speech, and be given the same standing constitutionally. (Posting the source code is a different story.) Let Microsoft extend whatever they feel like, we'll be right behind them developing tools that integrate nicely with those changes. Both these practices should be protected, as attacking one hurts the other.
This way, any percieved improvements are realized by consumers, regardless what product they choose, and competition is still occuring, with the consumer benefitting from the race. That /is/ the only thing the government is supposed to be concerned with in a monopoly case anyway.
Consumers do not benefit in any way by having the government soft-

enforcing a protocol tweeking taboo.

If you look closely at what's happening to GUI's right now, Microsoft /is/ competing, everyone is. Apple is making drastic changes in it's UI, Linux is also, and Microsoft is changing the GUI at a faster rate than they have ever done anything before. This race they're having is picking up speed and the consumer is benefitting on all fronts. And this is how it should be.

What we don't need right now is Big Brother stopping this race, so that Linux and Mac might slow down, and then we lose because competition has stopped again. Besides, it's getting interesting ;)

What I did to get a decent supply of cartridges for my HP 560C (paid
$7.00 for it at Goodwill) was buy up more printers at the thrift stores
averaging around $5 - $7 each (half that sometimes depending on what
color tag is on sale), pull out the cartridges, then redonate the
printers. One of them even had a couple extra sealed cartridges (2
black and one color.) So I'm set for a while.

I always thought most implementations of Linux included Netscape
Communicator anyway. And Opera would be a good alternative (rapidly
becoming my primary browser under WinBlows-98).

Gateway had other motivations for wanting Amiga.

Compaq puts out other OS's, ones that compete squarely with NT/2000!
Dell, IBM offer Linux.
Not to mention SGI offers unix.

Not sure where this rumor started, but I've heard it before.

Some do, some don't. (Debian, for instance, can't under its license.)
You also often get lynx, links, KDE's browser (Kylix? I forget) and so
on.

This is very different from integrating it into its interface, or some
other such nonsense which assumes all OSes work like Windows.

Nothing. Linux is not the product of a company that has a monopoly. So none of
these questions apply.

> Should they do
> anything?

But they aren't so empowered.
It's really very simple. The rules you have to play under change once you achieve
monopoly status. You may not use your monopoly to maintain or extend your
monopoly. So Micro$tuff is a very special case that doesn't apply to hardly any
other high tech company (possible exceptions: Intel and IBM [IBM once came close

to a breakup because of it's abuse of monopoly power, they backed down and played nice, something Micro$tuff doesn't seem to understand how to do])

Roy

> could not this empowerment also be used to bitchslap

Here's how it has worked with their "extensions", they made changes to Win 95 and Win 98 at the request of the Office programmers. Not too much wrong there. They made such changes available to the WordPerfect and Lotus Suite programmers, once those programmers learned of the existence of the changes, and then asked for the information.

Do you see the difference? In house products teams had weeks, if not months lead time so their products were out first, and had a much closer working relationship with the Systems programmers than ANY competitor could possibly have. That allowed the Office products to maintain and extend their lead over their major competitors. American law prohibits that as unfair when done by a monopolist.

The kicker is that Micro$tuff is STILL denying that they have a monopoly. I suppose they would only acknowledge it when/if they achieve their wet dream of all computers everywhere using M$ OS.

Ah, but what happened to DRI?
How often do you see the Lotus Office Suite (assuming IBM didn't finally throw in the towel) bundled with a computer? Or the WordPerfect suite? How much shelf space do they get at the Best Buy, Office Max, Office Depot, Circuit City, compared to M$??

>
>
> What we don't need right now is Big Brother stopping this race, so that

(sigh!) you're missing the point. Make something up yourself. We're not talking about what linux is, we're talking about what the government should be/shouldn't be able to do.

Anyway, linux isn't like /anything/, "linux" is just a kernel, I can make the "linux OS" anything I feel like dear. kernel 2.4 has a built in *web-server*, by the way, by "built in" I mean right in the kernel.

Not even Microsoft has a webserver in the kernel, so, how does "linux work" again? ;)

Nope.

> Make something up yourself. We're not
>talking about what linux is, we're talking about what the government
>should be/shouldn't be able to do.

And you're making some spurious links to Linux, not understanding the first thing about what you're talking about.

Remember: Just because MS do their Operating Systems one way doesn't mean all Operating Systems work that way. Hence, what the Government do there doesn't apply to some other OSes - because it's entirely irrelevant to them.

Government: "Microsoft, no integration of browser with OS!"
MS: "Squeak! Yes sir!" (eventually, maybe)
Government: "Linux, no integration of browser with OS!"
Linux: "Erm, we don't."

You're trying to make links between two entirely incompatible situations. What a Government can/can't do with Microsoft is entirely different to what it can/can't do with Linux - because the entire system doesn't work like that.

Free clue: When giving examples and analogies, try harder to make them relevant.

The question was hypothetical, the situation posed in a hypothetical
question need not be fact. The question I asked was "what if", and it's
an interesting question, what if Netscape decided to become available
free with every linux disrobution and became the almost exclusive
browser? what could the government do?

If that was the case, then "embrace and extend" would be moot anyway.

A monopoly means more than "most people use Microsoft." Microsoft does
not have a monopoly. Even, of all people, RMS has stated that everyone
has a choice of what OS to use. A corporation is not a monopoly because
the free will of the people chose one product over another.

Case in point: IBM, you /could not/ built an IBM PC without an IBM PC
BIOS, therefore IBM had complete /exclusive/ controll of the market,
regardless of the purchasing decisions of the consumer. This is what a
monopoly is.

(By the way, we broke that monopoly by reverse engineering the BIOS,
see? Kind of like the kerberos example. The court should do the same
thing they did then, allow an implementation of that functionality to
be duplicated.)

Microsoft, on the other hand, was voted to where they are now by the
purchasing decisions of the free willed people. There are alternatives,
for crying out loud Microsoft has one of the hardest competitors in the
world to compete with, a competitor who /gives it away/ (sound
familliar) and has both the popular and (arguably) technological
advantage over them. Not just in the OS market, but (especially) the
server, and (mostly) the webserver market. Microsoft's momentum is
/hardly/ increasing, and more and more options are developing every day.

> information.

A lot of competing companies had inside knowledge of Windows, look at
Adobe. Adobe knows more about the inner workings of the Windows Print
architecture than Microsoft. You know why? Adobe /designed/ it! The
public was highly skeptical about the quality of it before release, so
Microsoft called Adobe in and had them completely overhaul the entire
print archetecture. (there's actually a neat story behind this too)
How about the inner workings of Microsoft Networking and the NetBEUI
protocol? Did you know that it was ProComm who put that there? NetBEUI,
Microsoft's "plug-and-play" networking protocol, was purchased from
them.
Adobe has been successful in Windows printing, Procomm in networking.
Microsoft doesn't even have the edge on alot of the code they themselves
distribute.

> Do you see the difference? In house products teams had weeks, if not months lead

> with the Systems programmers than ANY competitor could possibly have. That
> allowed the Office products to maintain and extend their lead over their major
> competitors. American law prohibits that as unfair when done by a monopolist.

But the fact that others were developing and releasing competing
products, and making money doing it, precludes Microsoft from being a
monopoly at that point in time. If you remember, Lotus was very
successful. In the end we mostly moved to MS Office because we liked the
product better, if we didn't we, to this day, still have the choice of
using other products. StarOffice comes to mind as an excellent
alternative (I can't stand the interface though)

> The kicker is that Micro$tuff is STILL denying that they have a monopoly. I
> suppose they would only acknowledge it when/if they achieve their wet dream of
> all computers everywhere using M$ OS.

I deny it too. I have plenty of options. I'll deny it untill there arn't
any options. Then it will be a /monopoly/. A monopoly means NO options.
Like Bell telephone, IBM making the only machines with an IBM BIOS.
OPEC. Let's face it, it was Darwinism that built Microsoft, it's
Darwinism that will bring it down, and it can and /is/ happening.

> > Both these practices should

> > /is/ competing, everyone is. Apple is making drastic changes in it's UI,

>
> On yeah, and how much has their market share gone up?

Not relevant. It certainly can't be because of Microsoft Office,
because Office on the Mac is better and more stable than Office on the
PC (from what I've heard). This is (from "what I hear") typical, I hear
Photoshop and alot of other apps that exist on both Windows and Mac are
better on the Mac. This tends to put a few holes in the theory that
Microsoft giving inside Windows OS info to Office developers made
windows more popular, because that Windows OS Office is supposedly
inferior to the MacOS Office, regarless of "inside knowledge"
And the kicker is, You can have all the inside knowledge of the MacOS
you want now, at least the "Darwin OS" parts because it's OpenSource. So
according to the inside knowledge leads to market monopolization theory
posed, the Mac should be cleaning up, right? So how much /has/ there
market share gone up?

> > Linux is also,

> compared to M$??

About the same amount as the customers ask for them. Shelf space does
not a monopoly make, When I decide what to stock, it's based on demand,
and customer demand is the free will of the people, nothing more.

> > What we don't need right now is Big Brother stopping this race, so that

>
> You won't. Big Brother might slow down M$, but not competitors with less than 10%
> of the market place. In a case like this, Big Brother's job is to make sure that
> the race is fair to the little guys.

And what have the "little guys" been doing? Generally nothing untill
Microsoft develops something they need to compete with. There's been a
lot of companies resting on their laurels untill they /have/ to improve
something because Microsoft is killing them. Don't believe me? let's
take a closer look...

PalmOS, who swore up and down consumers don't need color. fine everyone
settles for b&w, and Palm own3Z the market. WinCE comes along, and Palm
responds with the new color models, but by now they're already losing

market share daily, and the palm VII I *just bought* is now on fire sale as best buy for half the price I paid a few months ago for it.

Novell, once prime master of the universe in networking, decided it didn't want to make a VXD implementation of Novell client for Microsoft right away, they decided their legacy .386-file architecture was all anyone needed. Microsoft, who at first didn't even install networking protocols in win95 by default, and even included a limited novell client, responded to the delay imposed by novell by incorporating NetBEUI (mentioned above) as a stop-gap measure untill novell woke up to consumer demand. Too late. novell is now largely irrelevant.

OS/2, an Operating system more object oriented than Windows is /to this day/ practically abandoned by it's creators even though people are practically begging them not to discontinue it. It's still a staple in most banks and runs a majority of the ATM machines out there. IBM has publically stated they don't plan on supporting this OS.

BEOS, a very capable OS, but one that it's creators have no interest in persueing, deciding they want the embedded market, despite a loyal following of users and tinkerers. Heck, by the time I even discovered BEOS, they had already abandoned it!

On the other hand, there are very good developers out there that make a killing competing against Microsoft because they are /good at it/ and the consumer /prefers to use them./ Adobe is a prime example here, as are Macromedia, Citrix, Borland, Sun, AOL, Symantec, Peachtree, Intuit, and many others. They have prospered because we vote for them with our patronage when we choose them over Microsoft. They have responded to the demands placed upon them by the consumer, faster or better than Microsoft has, and thus prospered. This is how it oughta be.

Some people may feel sympathetic to Netscape, but the fact was they were charging money for a product that could have taken on microsoft and won, but they decided they preferred to be Adware instead. they could have improved their product, but they decided to open a portal during the portal craze and rest on the portal, and their laurels. If Microsoft didn't do it, someone else would have.

that's the thing in a free market, you live with the fear that someone will be faster, better or cheaper than you are. You adapt, or you win the Darwin award.

Anyway, back to your original comment, the government's job is *NOT* to make the race fair to the little guys. the goverments job is to make the race fair and beneficial to the *consumer*, even if it means the "little guy" goes out of business. the government has the power to grant monopolies for this purpose so long as it benefit's the consumer.

But again, Microsoft is where they are because we put them there, and it's in our best interest to let them compete.

Actually, now that we somehow got our shirt stuck on this nail that
wasn't relevant to the subject at hand anyway, just kind of provided
like a freehand sketch for those that lose interest in the text without
pictures version...

Linux is not an Operating System. It's not up to "Linux" what gets integrated into the OS. Redhat, Slackware, ect are Operating Systems, They decide what gets integrated into the OS. Linus is just a kernel.

The Analogy was NOT between "Windows and Linux", The analogy was between two "Equally /available/" operating systems. the consumer has the same access to one as the other, illustrating something not true in a monopoly.

As for (re: linux) "They don't do that", who are "They?" and what dictates what "they" do? Is not Linux open for anyone to do what they please? In my "Linux on an Amiga in a Box" half-hearted kill-time project I work on ocassionally, should I contact "them" to find out what I can and cant do because "we dont do that?"

Unless Linus has contacted the hundreds of copyright holders on the various pieces of code, and they all decided to stop distributing the source under the GPL, I'm pretty sure I can integrate anything I damn well please into the kernel, or my OS. Of course it will be tricky, as I'm using the uClinux kernel so as to make it work on older Amiga's without an MMU/and UAE, and I can't get the file system to work, even though everything "should work" (I'm abandoning it soon I believe, I've decided it's time for a new project, a gnutella client that doesn't suck)

Back to the point, the question (again) isnt like you said, "What they can/can't do", I asked what they "Should/shouldn't be allowed to do", this isn't a question of opportunity or current legal precidence, but a hypothetical question of ethics and what level of government inervention is beneficial to the consumer, and why.

The answer to that question is they should either A) side with the small businesses being hurt by Microsoft, or B) side with the consumer, who chooses to use the Microsoft product over the competitor.

I wasn't expecting C) "Linux doesn't work like that", and I apologise for my foggy analogy. The illustration was an afterthought ;)

The following was posted to soc.genealogy.britain. The advice is good,
and lets hope this idiot gets a lobotomy soon.

==========

Copied from soc.genealogy.britain .....

Please folks..... totally ignore these posts. They are all from some
jerk named Mitchell, aka "Hipcrime" and he has been flooding two news
groups in particular........ hundreds of nonsense posts a day. And you
can't block them without a special programme..... as he has automated
each one of them to post from a different ISP, IP and name.

N.a.n.a.e (News.admin.net.abuse.email) has been totally deluged. If you answer them..... you are talking to the wall as they are automated. There is a News programme that can be programmed to block them, but the ordinary OE or Eudora, etc. cannot do it.

Let's hope it is just a passing fancy re genealogy groups. He has cross-posted them to n.a.n.a.e and I took it out..... so you can imagine how flooded it gets.

Regards,

Barry Ruck. Harlow, Essex.

> someone out on the street. What could the government do? Should they do
> anything?

Linux doesn't need to "incorporate it into its interface" in the way you
mean... There are several free web browsers included with every linux
distro. And yes, depending on which windowmanager/desktop environment you
choose, there are integrated ones. But not of them are forced on the user.

And as the source code is free... It would be easily UNintegratable if
someone DID want to reassert their choices.

>> Kerberos is the perfect example.
>> They took the code from the FreeBSD codebase. As FreeBSD license allows

> government is empowered to bitchslap developers who change protocols
> to extend them, could not this empowerment also be used to bitchslap
> developers who reverse engineer protocols to be compatible?

Think of it this way. Someone working on FreeBSD wrote that kerberos
protocol. OK, he released it under the FreeBSD license, but when M$ extended
it, did he get anything for it? Did he even get to see the changes?

That's why I prefer the GPL over FreeBSD. Microsoft CAN'T use that code
legally without releasing any changes they make back into the community.

> I think the safest ground we could stand on would be that protocols

> be protected, as attacking one hurts the other.

fine... let them keep the source, but they DON'T publicise the actual
protocols... Hell, even their own protocols (word document format anyone?)
aren't fully compatible with each other in an attempt to force people to
needlessly upgrade their software.

This is normal. I guess this is mainly for "backwards compatibility".

> Problem 2 is annoying. I'm pretty sure my colors are off and I have no idea
> how to tune them.. There is no hole through which I can tune a color pot,
> and nothing to tune on the monitor, so what do I do?

My 800XL does have a hole for color tuning, but maybe you'd have to open the
case to reach it. If you turn the computer around (upside down, that is) such
that the cartridge slot and the monitor connector is "away" from you, you find
the color adjustment in the right front edge. It's a hole that looks like it
would carry a screw, but it doesn't. A tiny screwdriver is required to adjust
it.

So long,
Thomas

Anyone who can use a command line as per the Apple II shouldn't find adapting
to Linux very difficult. It is only GUI users (like Windoze) who find things
"unfriendly".

I think you are missing the point. Rolls Royce still make cars to a standard not to a price. Kit cars (usually VW based) are still available. I think a "kit computer" is a nice niche idea. I certainly subscribe to the idea behind it.

Sattingers Law : It works better if you plug it in.

4781. Polish Summer - Lato Ludzikow 2001 - copy party!!!

Newsgroup: comp.sys.atari.8bit
Date: 2001-07-29 18:42:36 UTC
From: Vasco <vasco@owl.au.poznan.pl>
Message-ID: <9k1mf6gih1@news.tpi.pl>
Source record: 35005

Hello!

I would want all to remind about Polish copy-party, which will
begin already in nearest Thursday (2.8.2001) and will end
in Sunday (5.8.2001).

To fall from Westerly Europes with railway, you must run to
border Poland - German in Frankfurt/Oder, and from there
to get to Poznan (Posen). From there to Opalenicy is already
not far.

If you want to go car, I instruct rout Berlin-Poznan.
In localities Lwowek You should strand right and farther
straight to Opalenica.

If you have some questions, then I ask a favour to hurry,
because from nearest Wednesdays I will not be able to answer
on e-mail!!!

On 90% on party present will be Nir Dary from Israel!!!
If he can come, then you surely also! You have nearer! :)

Vasco/Tristesse, main organizer :)

Here several of select trains, which can help in getting on party-place:

Berlin ZOO (6:50) -> Frankfurt/Oder (8:17) -> Posen (10:07) EutoCity train

Berlin ZOO (12:50) -> Frankfurt/Oder (14:17) -> Posen (16:07) EutoCity train

Berlin Licht (16:06) -> Frankfurt/Oder (17:40) -> Posen (19:09) EutoCity
train

Berlin ZOO (19:00) -> Frankfurt/Oder (20:22) -> Posen (22:15) EutoCity train

... and still with rout from Poznan to Opalenicy about hour:

- 10:10 (to Frankturt/Oder)
- 17:18 (to Rzepin)
- 20:55 (to Rzepin)
- 23:08 (to Rzepin)

... and other non-Express in directions: Zbaszynek, Rzepin, Zielona Gora

Exists also second possibility. You should get to Frankturt/Oder and
to get out on first Polish station: Rzepin and farther to go with
personal (normal, non-Express) trains in direction Posen:

- Rzepin 10:55 -> Opalenica 12:42
- Rzepin 14:08 -> Opalenica 15:58

Or:

- Frankturt/Oder 14:58 -> Rzepin 15:42 -> Opalenica 17:25

- - - - - - - - - - -

And I remind official invitations:

- -
Lato Ludzikow (People's Summer) 3
August, the 3rd-5th, 2oo1
Taklamakan, Opalenica, Poland
ATARI Copy Party
Invitation
- -

What everyone guest has to know...

It's third edition of this party, and (both with
winter 'Last Party') it is seventh party in this place
allready! Sincethe famous QuaST party has dead,
parties in Opalenica ('Last Party' on December &
'LL' at summer) became the most important Polish
Atari fans party. It's dedicated to all Atari users:
ST, ST(e), TT, Falcon, and of course XL/XE.
I must notice, that it is NOT a commercial party.
No one will get a profit of making a party. A money,
you will pay for enter, is only for renting a place
and for praizes.

Yes, but what is the cost of it?
We live in a kapitalistic country, and no one will
give as a place for free. That's why we have to pay
40 zl (it's about 20 DM, I think, that is not much for
people from western Europe).
We know, that (for a difference) a trip will be
very expensive for people from ex-communist
countries, that's why, if you are from: Czech,
Slovakia, or ex-USSR (like Latvia, for example),
you may enter FOR FREE!!! You can bring a good beer
for organizer if you want.
Of course (because we are not feminists) women
always enter for free! So You can take your girl/wife
with You with a not much cost.

When?
Party will be at the first weekend of August
(just like the QuaST party). It means from the 3rd
(Friday) to the 5th (Sunday). Official opening will be
on Friday, but You can arrive on Thursday's
afternoon - party place will be open, and some people

will be there allready, I think. Official closing is on
Sunday about noon, but You can stay on party place
to the late afternoon.

Where I have to go?
As it was said, this party takes place in Poland
(Poland is in Europe, betweem Russia and Germany,
if you are not good in Geography ;-). A small city -
Opalenica is at west from Poznan city (Posen),
near west border of our country. All trains (without
Express, IC, EC) from Frankfurt/Oder (Germany)
to Posen are going through Opalenica (just look
for yellow train station).
Party place is (as always) in City Culture Hause,
called 'Taklamakan'. How to get there from the station?
It's about 800 meters long walk. You should go along by
'Dworcowa' street. At it's end (where is railway crossing
at left), turn right to the '5-go?Stycznia' street. At next
crossroads turn to 'Powstanca Kozaka" st. Walk ahead 100 meters
and turn right to 'Farna' st. At it's enf you will see
city-hall. Then turn right, and left to 'Mickiewicza' st.
About 50 meters later You will see so long awaited
'Taklamakan'. Hurra!
If You think, that's a bit complicated, I have
a good information. Probably always someone will wait
for You at railway station!

What should I expect at this Takla...?
* A big show-hall where You can put your hardware
(or see others' one). This hall has a big scene
for Atari Scene ;-).
* A separate sleeping-room.
* A pizzery in the same building.
* A shower (wow, great!).
* And (the most important!) a lot of famous Atarians!
And great Atari hardware.

You can also expect competitions (music, graphic,
intro & demo). Bring your own production to participate
in competitions!
You should not expect a comfortable beds, so
take your own sleeping-bag! You may take your hardware
(don't forget about monitor, cables, etc).
Probably we will also make a camp-fire one night
(yes! in the city!) to roast some sausage and talk to
the morning.

Competition rules (XL/XE)
Some general notes:
- There's have to be not less that 3 works to make
the competition.

- In the case of very many productions organizers
will do a selection.
- A compo-work has to be described in DOC file
(a kind of competition, name of work, author(s),
adress).
- Author don't have to be on party (it means, that
You can bring your friend's production if he can't
arrive), but in this case author will not get the
prize (if he win of course!).
- All competiton works are freeware!
- All participans will be in Jury.

Music compo:

- Plaing time is 3 minutes max. Longer tracks will be
turned off.
- It must be your original composition (it means:
no 'convertions', no 'covers'!!!).
- You can use someone elses' samples or
synthwaves, but You should describe this in DOC file.
- Track must not be a *.COM file!
- Allowed formats (composers):
- Chaos Music Composer (CMC),
- Music ProTracker
(MPT, MD1, MD2 + SMP),
- Theta Music Composer (TMC).
- All tracks will be played with MacGyver's
Mega Player 1.6 or 2.1.
- Music will be played in stereo!
- Music can be in other format, if you bring
a player & composer, and organizer will agree!
(Using extra memory for music compo is not allowed!).

MOD compo:
- Only *.MOD format (known from Amiga 500).
- Max module length 170 KB.
- One sample may be 32 KB, rest only 16 KB.
- Tracks will be replayed with Inertia
Player 4.1/4.12/4.5.
- Tracks will be replayed with 4-channels
8-bits music card (freq. 11.5 kHz).

Graphics compo

- Allowed formats: MIC, PIC, GR8, GR9, CPR, INP, INT,
XLP, CIN, HIP.
- Another formats may be allowed if the painting
program is available for every one (for example
PGR) - but organizer has to agree.
- Converting from other computers and scannings
are not allowed. Picture must be done on Atari!
- Redrawing someone else's pictures is not allowed!

It must your original work!

Intro 256 B compo

- Maximum length of code is 256 bytes,
but one dos header and one run/init
vector will be not included in counting.
- Intro must not use extra ram (it must run on
64 KB mashines).
- Intro must run from DOS (MemLo not higher than
$2000), but it doesn't have to back to DOS.
- Sound (if someone can put a music into) will be
in stereo.

Intro 16 KB compo

- Maximum lenght of file is 16 KB.
- Intro must run on 64 KB mashines.
- Intro must run from DOS (MemLo not higher than
$2000), but it doesn't have to back to DOS.
- Sound will be in stereo.

Demo compo

- There is no limit of maximum lenght.
- Demo must run with DOS (MemLo not higher than
$2000), but it doesn't have to back to DOS.
- All callings to disk must be with 'D:' device only
(not 'D1:' !!!) - it's because it must run from
subdirectory and/or HDD.
- If demo has some effects during loading,
it must not use RAM under FPP area -
it's because it must run from HDD.
- Demo can use 320 KB of memory on PortB
(+256 KB). It cannot use separatelly acces
for Antic/CPU (like 130XE or Compy Shop).
It means both Antic & CPU must use ramdisk
together (another explanation: an acces
like: Antic - extra ram & CPU - base ram
is not allowed) That's because demo must
run on every kind of RAM upgrade.
- Another RAM upgrades are not allowed to use
on competition.
- There must be an option to change used memory
banks! It should be a kind of setup with all
possible 64 banks to select!!!
- Sound will be in stereo.

Ending words

I'm waiting for You!
Come to keep Atari scene alive!

4784. re: Let's burst outside the secret web servers, but don't stop the flat telephones.

Newsgroup: comp.sys.atari.8bit
Date: 2001-07-29 19:06:25 UTC
From: Mark Boulet <hadu@uvugi.mil>
Message-ID: <832782E4.244217C5@uvugi.mil>
Source record: 34879
Cross-posted to: news.admin.net-abuse.email,comp.sys.atari.8bit

I create bright interfaces beneath the untamed usable filter, whilst
Orin surprisingly tolerates them too. Many clear analysts are
virtual and other strong scanners are new, but will Toni cry that? As
weekly as Liz disrupts, you can pull the protocol much more nearly.
Where will you compile the actual closed tablets before James does?
Do not defeat eventually while you're rebooting inside a soft
ethernet. Why did Eddie roll with all the firewalls? We can't
flow bugs unless Lionel will angrily annoy afterwards. Otherwise the
telephone in Bill's tape might moan. Tell Nelly it's lazy eating
about a screen. Vincent will contribute the lost backup and
interface it inside its monument. Oscar relays, then Hector
regularly facilitates a solid rumour alongside Sam's backup.
Well, William never preserves until George interfaces the sticky
printer undoubtably. I'd rather load usably than produce with
Edwin's ugly mouse. The extreme text rarely obscures Donovan, it
defiles GiGi instead. While newsgroups freely start, the operators often
kick against the unique stacks. The discarded official error
builds over Ignatius's pathetic backdoor. Will you jump against the
cyphertext, if Jonathan partially binds the email? My stupid
FORTRAN won't fetch before I dump it. The BASICs, administrators, and
algorithms are all odd and violent. Let's consume over the idiotic
interfaces, but don't restore the root outputs. The hard idle
laptops admiringly prioritize as the minor desktops locate.
Some rough offensive cryptographers will wistfully examine the
Pascals.

Why should they have to though? What extra power would my parents get (word processing, internet, dtp, spreadsheet) by using Linux over Windows or her Mac (actually my old Mac)? What advantages would I have in using Linux over Windows as an application programmer using VB, C++ Builder, VC++, Jbuilder, SQL Server etc?

> --
> Security-wise, NT is a server with a "Kick me" sign taped to it.

And there are not dozens of known security holes in most Unix/Linux distributions? Every scanf(),gets(), sprintf(),strcpy in the OS is a potential security hazard.

The offensive post was machine-generated trash.

The garbage wasn't crossposted by a regular user of
news.admin.net-abuse.email, it was part of a flood of
abuse by someone(s) who call themself(s) "HipCrime".
HipCrime doesn't think posters should have to obey
newsgroup charters, and that they should be able to
post as much of whatever they want to any group they
want any time they want. He has created a tool called
NewsAgent to this end.

Now would be a good time to tell your news server admins
about this. Yesterday would have been better. Tomorrow
might be too late.

----- Quote from Hipcrime info post by Caveman Og -----

See the "HipCrime Information Center":

http://extra.newsguy.com/~rchason/

It's missing some information, and is probably not accurate as to the
identity of the current "hipcrime", however, the names mentioned there
are well known in NANA*

I say "current", because "HipCrime" is used to refer not just to the
author of "HipCrime's NewsAgent" which is being used to create the
floods and cancels, but to the rather limited audience of users: to
wit:

Steve Boursey, in Tim Skirvin's words:

http://www.killfile.org/dungeon/why/boursy.html

John Grubor, also by Tim Skirvin:

http://www.killfile.org/dungeon/why/grubor.html

HipCrime's "argument" is the USENET cancels are "censorship", and that anyone should be able to post anything they want, anywhere on USENET. Needless to say, allowing that would make USENET even more of a mess than it already is.

I too rather doubt John Brunner would be amused.

--Og

sigh

Which particular Linux "interface" are you referring to?

Free clue: Linux doesn't have any one single interface into which a web
browser can be integrated, unlike some other OSes. Similar things apply
to many Unix derivations/clones/flavours etc. Given the open-source GPL
nature of the Linux, it would be nigh on impossible to integrate
something in a manner such that it couldn't be unintegrated and, in many
ways, Linux is essentially the kernel and helper apps. The interface is
virtually entirely customisable, since all the kernel hooks are well
documented and available to all.

But it seems like that's how the hardware support comes about. It seems like you pretty much have to buy peripherals that have been out for about 3 years to get full support in Linux.

This right here is what I am thinking. A lot of other posts in this thread have talked about PC components. Come on people! PCs are no fun! We all like our obsolete computers (whether you consider them obsolete or not, I personally couldn't find anything useful to do on my Atari if I tried) right? We just want something a little more powerful so we can do all the things we need to do and throw out those stupid PCs which are just a bunch of parts sloppily thrown together. Even if there were an OS for PC that we liked it wouldn't matter much because PC hardware just sucks. Maybe you don't agree but this is certainly my opinion. I'm an assembly language person and I find C++ (the language that "everyone" uses now) to be completely unnatural. It isn't practical to program PCs in assembler because there is so much different hardware (can't find programming info for most of it either) and because most of it looks like it was designed by crazy people.

Sooo... I use my PCs for internet access, for games (just emulators and Doom network games actually), for playing music, the occasional school assignment, and for programming (for non-PC systems of course, like the Turbo Grafx 16 for which I've written half of an RPG in Hu6280 (like a 6502) assembly). One of the many things I like about my Atari is the fact the motherboard is not too dense, I can go in and unsolder stuff and solder other stuff on. There is no way to do that with a PC motherboard (at least on anything newer than a 286) because of all those tiny little pins on the chips and the four-layer construction. Taking all of this into account, my system would look like this:

1. nice, simple CPU (since I'm a fan of the 6502 I'd use one of those great Western Design Center 65816's. one of those eZ80s that I've heard about would be good I guess. 80x86 chips are out of the question of course), with a clock speed

in the double digits (decimal digits, not hex :))

2. 2 MB or so of RAM would be fine for what I'm doing

3. A cool video chip like old computers had, that means something other than just a frame buffer and a DAC, something with sprites and layers and maybe polygons. I would like something with 256 colors at 640x480 (the V9990 chip used in the 3DO would be great, the chips from the later MSX computers would be OK)

4. A likewise sound chip, something with 16-bit stereo PCM but also with some good old FM channels or square waves or something

5. an EIDE interface

6. built-in ethernet

7. some REAL joystick ports (the kind where you read a register and each button is represented by a bit)

8. expansion slots

9. An OS which isn't bloated and slow, which includes a command line interface, and which isn't designed to protect idiot users from themselves

Perhaps within the next year or two, when I have some money and some time, I'll build something out of a 65816 development board. Then again, I might spend all my money on mods/paint for my BMW (which is around the same age as my Atari 8-bitter of course).

And I answered your question with a real world answer. The US government, at least does not now have that power. The only power they have to do anything like you asked is only if the corporation in question is a monopoly, and is using it's monopoly power to extend or maintain it's monopoly.

Since Netscape isn't a monopoly (not even being owned by AOL qualifies them for that), and Linux isn't the product of a monopoly, there isn't a hypothetical to ask, unless you first suggest that Congress passes a law that isn't even in question, and that the President's veto isn't overridden, and that the Supreme's say is constitutional. That

isn't hypothetical, that's a chemical induced nightmare. ;-)

Monopoly does *not* mean that *everyone* uses your product. AT&T was a monopoly, even though there were several other competitors (GT&T, IT&T, here in eastern Nebraska there was LT&T, and so on), AT&T was a monopoly because they had a super majority of the business, and there was no way that any of the competitors could take the monopoly away from them.

Besides, your opinion doesn't count, and neither does mine. The trial court found that M$ *is* a monopoly, and the appeals courts sustained that decision.

c. 90% of computer desktops does equal a monopoly.

> monopoly is.

LOL - no, not at all. Ever hear of Phoenix bios? Award Bios? Ever hear of Dell, Compaq, Tandy? They all made machines that were IBM compatible, and IBM long ago lost control of the market. How silly of you.

IBM's monopoly was in mainframes, and even there they had competition. But they used their monopoly power to squeeze the competition, which is why the Feds came down on them. IBM settled out of court. M$ isn't that smart.

>
>
> (By the way, we

We?

>
> Microsoft, on the other hand, was voted to where they are now by the
> purchasing decisions of the free willed people.

Not really. M$ makes their money on Office not Windows. And of course, not on Explorer. But Navigator was a threat to Widows as a platform on all OSes, and therefore a threat, in time to Office and M$'s monopoly.

So they cheated.

They did what was illegal for them to do at that stage.

> There are alternatives,

Oh yeah, GEOS is taking the world by storm, isn't it?
How many consumer machines at Best Buy, Circuit City, Office Max, Office Depot, Sears, and Walmart have Linux pre installed on them? Have you seen ANY??

How many machines do you see in those stores that have applications software (Works or Office type) that are made by a competitor of M$? Have you seen ANY?

>
> for crying out loud Microsoft has one of the hardest competitors in the

> advantage over them.

You don't have to have a monopoly in every niche to be a monopoly.
And Linux hasn't won even in these fields - yet. It certainly doesn't have a monopoly even in those niches.

Adobe isn't selling an Office suite either are they?
Office is M$ bankroll.
By the way, how much do you hear about Novell and networking any more? A real powerhouse like they were in the early 90's right?
And M$ often buys technology, that's not news. Nor does it have anything to do with their having a monopoly in Office Suite or on Desktops.

Did you notice what happened to Stacker? Or After Dark? Products that aren't sold, in part, because M$ bought such technology and incorporated into their software, so consumers didn't need to buy and so didn't buy such products.

See, that's a real problem. If you get M$ Office for free, why would you buy WordPerfect? If you get a screen saver for free, why buy After Dark? If you get a browser for free, why buy one?

And when such actions are done by a monopolistic company, it's illegal.

Hm? With the possible expection of SB Live!, my keyboard and mouse and
disk drive (newer than three years, but the designs are not changed, I
guess), there's no components that are even nearly three years old on
my Linux box.

(Other hardware includes TB 1200, A7M266, Geforce 2mx, two IBM
Deskstar HDs, HP 9120 CD burner and two NICs - all which is rather recent)

Didn't have a single problem with this configuration.

Then again, I'm not using USB stuff but rather more 'traditional'
hardware.

I see now- it all makes (non)sense. I only recently (yesterday) started downloading these headers. I guess before then it was being filtered by Ma Bell.

I see now- it all makes (non)sense. I only recently (yesterday) started downloading these headers. I guess before then it was being filtered by Ma Bell.

This one's easy (although I wouldn't say Red Hat "sucks")

For starters lets take a look at the included version of GCC.

Can you even recompile the base kernel with it?

I wouldn't say any OS sucks because of the "ease of installation"
because if the OS is worth it's salt, you're only going to install it
ONCE anyway.
However, the compiler thing, I just have to sit back, shake my head and
wonder what WERE they thinking?

Easily, maybe, I can also easily unintegrate IE from Win98 too, there is a way to do it ;) (Was quite an embarassment too, after MS said they couldn't!)

In my personal opinion, I really hate the BSD license, for this very reason. I mean, it's fine if you don't WANT to see your code when it's reused, but I wouldn't choose it.

> That's why I prefer the GPL over FreeBSD. Microsoft CAN'T use that code

Agreed.

That's why I save everything in Word 6 format ;)

In the case of kerberos, they did publicise it, in fact, they publicised
the source code. While the NDA keeps you from using that source code, it
doesn't keep you from implementing the protocol.

LOL I love that line ;)

There are things in linux that it really is harder to do than in
Windows, but these things (like routing, wierd protocols like PPPoE)
are things usually done by someone who should probably spend a little
time learning anyway.

Sure linux has a learning curve, but it's a freaking computer, when did
the notion that computers had to be usable by people who didn't want to
learn anything become popular?

4808. A few items I have for sale here...

I've got to make some space before my girlfriend kicks me and my computers out! I was going to put these up on Ebay, but I'm waiting for her to use the rest of the cameras film. So I thought I'd check here while I'm waiting, make me a reasonable offer on anything- or all of it!
Don't forget to remove the 'nospam' when emailing me.

Mo
mygranny'nospam'@'nospam'swbell.com

Atari items:

800XL w/ original box (very tatty but intact) Box has the 1984 olympic logo on it. Computer works fine but the power supply is flaky, could probably use a new one or rebuild.

Percom Disk Drive- I have no idea about this one, it has a set of DIP switches on the back as well as both atari connectors and maybe TRS-80 connectors. I'm not sure to be honest. Built in power supply.
No documentation but I'll throw in an SIO cable.

Pointmaster Joystick, looks okay.

1010 recorder w/ original box. Box has seen better days, but it's intact. No power supply, sorry. Untested.

RamCram 32K ram card for the 400/800 This has worked for me 5 out of 10 times. Maybe needs a chip to be reseated.

Atari Acoustic coupler, 300 baud. No power supply, no cables. I believe it works though.

Carts-

BASIC (of course) -I have several of these to dispose of.
Centipede
Atariwriter
Skywriter

Software-

Thorn EMI - Home Financial management
tape and box, no docs

A bunch of educational childrens software-
All of these go together!
Edufun- Aliencounter w/folder of stickers and whatnot, complete.
AEC- Reading Comprehension skills

Loose tapes-
Disney-Mickey and the great outdoors
Sammy the Sea Serpent
Let's spell
Preschool IQ Builder

Email me with any offers you might have.

```

The question (as posted in another article) had nothing to do with the
power they now have, but what power they should have, and why.

> Since Netscape isn't a monopoly (not even being owned by AOL qualifies them for that),
> and Linux isn't the product of a monopoly, there isn't a hypothetical to ask, unless

> isn't hypothetical, that's a chemical induced nightmare. ;-)

But the question was what if they were, saying "but they're not" changes
the question.

A monopoly means the consumer has no choice. As for AT&T, I never had a
choice. I can choose alternatives to Microsoft.

> Besides, your opinion doesn't count, and neither does mine. The trial court found that
> M$ *is* a monopoly, and the appeals courts sustained that decision.

LOL, we are talking about opinions here. I don't pretend that anything I
say is going to be passed as law :)

That proves my point, the government didn't break them up, Phoenix made
a clean-room implementation of the BIOS, allowing machines to "truely"
be IBM compatible.

> IBM's monopoly was in mainframes, and even there they had competition. But they used

;)

I'm sure you could think of an alternative if you tried.

> How many consumer machines at Best Buy, Circuit City, Office Max, Office Depot, Sears,
> and Walmart have Linux pre installed on them? Have you seen ANY??

I sell them. If you wanted one and can't find one I'm sure I could hook
you up.

> How many machines do you see in those stores that have applications software (Works or
> Office type) that are made by a competitor of M$? Have you seen ANY?

Emachines come with StarOffice, and are sold at OfficeMax, among other
places. We offer Corell Office 2000 in addition to MS Office 2k, along
with StarOffice and a few others.

> even in those niches.

The problem is that "monopoly" is becoming too loosely a term. Microsoft
may be guilty of unfair marketing practices, but "monopoly" they are
not. There are choices, and the consumer can choose anything they want.

The governments role is *not* to protect other businesses from
microsoft, but to protect the *consumer*, and right now, the consumer
has choice. if the government happens to do something like pull a
product that the consumer WANTS, then the government is stepping on the
rights of the consumer in favor of the businesses that wern't chosen by
the consumer.

Adobe competes almost squarely with Microsoft Office in many areas.

Pagemaker -> Publisher happens to come to mind.

> By the way, how much do you hear about Novell and networking any more? A real
> powerhouse like they were in the early 90's right?

This was mentioned in another post, they dropped the ball when Win95
came out. What happened to them was they rested on their laurels. They
failed to create a .VXD architecture based client for Windows,
overconfident in the believe the consumer wouldn't mind running the
legacy .386 architecture client. The same thing happened to After Dark,
which failed to rewrite their 16-bit code. This was not Microsofts
fault.

> And M$ often buys technology, that's not news. Nor does it have anything to do with
> their having a monopoly in Office Suite or on Desktops.

But it does have to do with the misconception that they have "inside
knowledge," when there are many people with inside knowledge to the
Windows OS.

> Did you notice what happened to Stacker? Or After Dark? Products that aren't sold, in
> part, because M$ bought such technology and incorporated into their software, so
> consumers didn't need to buy and so didn't buy such products.

Stacker was a dangerous product, as is any disk compression that is
filesystem based. They became irrelevant because HDD's became cheap. I
don't even USE compression on my drives, do you? After Dark was a legacy
application that insisted the consumer should be satisfied with a 16 bit
application in their 32 bit OS.

> See, that's a real problem. If you get M$ Office for free, why would you buy
> WordPerfect? If you get a screen saver for free, why buy After Dark? If you get a
> browser for free, why buy one?

So the government should side with the small businesses over the
consumer? By that logic I suppose the government should ban TV news to
protect the newspapers which you must purchase.

Anyway *NOONE* gets MS Office for free, you might recieve it bundled
with a computer. but it's included in the price of the computer, it's
NOT free.

You don't think someone will buy a product just because they have one
that's free already? Why would anyone buy Windows then? Or the
newsreader I'm using now when I already have the MS one? When there is a
BETTER product, people will buy it.

This decision is best left to the consumer.

Everything. The entire user experience from start to finish. A few notable points:

The installer *still* complains if you try and put a boot partition above 1024 cylinders and absolutely refuses to allow you to continue (unless you go with it's suggested partition arrangement in which case it just suggests that you don't do that[1]) despite being perfectly capable.

The hardware detection is pathetic compared to other distros. Even simple things like making some use of the Windows key which is on almost all keyboards these days isn't done for you.

The configuration tools are scattered all over the place, all work differently and most are quite counter-inituitive. The auto-update is rubbish compared with the Mandrake equivalent, requiring you to faff around with their website[2] and send them all the sorts of details that everyone was worried Microsoft would want from you when they thought up Windows Update.

Need I continue?

AndyC

[1] And what the f*ck is the point in "recommending" a partition arrangement if you are then going to announce that it isn't recommended.
[2] Which, stupidly enough, only seems to work properly in Internet Explorer under Windows.

Indeed. Of course the trouble with the Linux community is that they just
aren't devious enough. They should've taken Kerberos, added their own
proprietary extensions and then released them under the GPL.

Hmmm, where's my compiler gone...

AndyC

4812. Welcome to comp.sys.atari.8bit!

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

Yes, it's a babblebot/cancelbot flood perpetrated by something calling
itself Hipcrime in the name of free speech -- its own!! Please search
Google for the terms Free Speech and Hipcrime, then you'll understand
why this creep is abusing all of USENET and news.admin.net-abuse.email
particularly.

>A monopoly means the consumer has no choice.

Not in the real world.

A choice can still be available when a company is monopolistic - like Microsoft, for instance. And most users *didn't* get a choice, because of the licensing agreements with major PC manufacturers which is how a lot of people buy hardware.

I am looking for ROMs for the following games. Please let me know if you have
them or know of an archive site that has them. Thanks.

The Bartender
Castles and Keys
Des Chiffres et des Lettres
Conquest of the Crown
Crash Dive (the 20th Century Fox version, not the ANALOG magazine version)
Flapper
Jukebox
Revenge of the Beefsteak Tomatoes
Ripper
Webster: The Word Game

I didn't mean to say that you *had* to have old hardware, but I guess it
came out that way. What I meant was that if you have a PC that was
built with no consideration for Linux, you can't reasonably expect all
you peripherals to be fully supported should you decide to install Linux
on it, if the peripherals are relatively new (not the actual cards, but
the chipsets or firmware used).
